TIMKEN. WHERE YOU TURN.

The world turns to Timken for innovation to move ahead of the competition. Our contributions to advancing work and living standards – through innovations surrounding friction management and power transmission – are invaluable. We have played a role in virtually all major technologies that have shaped our age, from automobile travel to artificial hearts. You'll find our products wherever you turn – on land, sea and in space.

When customers turn to us, they are turning to a worldwide team of 25,000 associates. Because of our ability to help their products perform better, customers honor us with more than 300 awards each year. Whether it is a wheel assembly for a family vehicle, bearings for a roller coaster, repair services for rail bearings or steel for an aircraft engine shaft, we supply the products and services that help keep the world turning.

FRICION MANAGEMENT SOLUTIONS – A TOTAL SYSTEM APPROACH

As needs change and advanced motion control systems evolve, Timken is leveraging its knowledge of friction management to offer a broader array of bearings, related products and integrated services to the marketplace. We supply quality products and services that extend beyond bearings to help all systems run smoothly.

We are committed to providing a wide array of friction management solutions. Customers can benefit by having Timken, a trusted name for more than 100 years, evaluate entire systems, not just individual components. This approach provides cost-effective solutions, while also helping to achieve specific objectives.

TECHNOLOGY THAT MOVES YOU

Today, major industry turns to Timken for our ability to influence the fundamentals of motion through the creation, transfer, and control of power. We invest in people, attracting scholars, engineers and specialists from around the world. We invest in tools – computers, manufacturing equipment and state-of-the-art laboratories. And we invest in the future by identifying new concepts that will help Timken and its customers make their mark for years to come. Innovation is one of our core values.

The return on our technology investment has grown exponentially. Our associates increase the reliability of Timken® products and create designs that can set new performance standards. We help customers solve their immediate system issues, while developing the systems of tomorrow.

Our teams of engineers and scientists are dedicated to using everything they know about friction management and power transmission. They translate the scientific aspects of metallurgy, bearing operating characteristics, lubrication, torque, noise, heat treatment, advanced processing concepts and application development into friction management solutions.

Because our teams are located at technology centers in North America, Europe and Asia – as well as in our manufacturing facilities and field offices on six continents – customers have access to ideas and resources to transform concepts into reality. Our technology focuses on products, materials, processes and emerging technology to create new solutions.

BRANDS YOU CAN TRUST

Timken has built a strong tradition of quality, technology and innovation. A long list of customer certifications provides solid evidence that our products have earned customer trust. As our founder, Henry Timken, said, “Don’t set your name to anything you will ever have cause to be ashamed of.”

The Timken® brand also reflects the well-known quality of Torrington® and Fafnir® product lines. By leveraging the benefits of these brands from design to distribution, Timken gives customers expanded options and the security of knowing that each box contains an industry-trusted product.

ABOUT THE TIMKEN COMPANY

- Timken is a global, Fortune 500 company.
- Timken has ranked among the 250 largest U.S. industrial corporations since the 1920s, and it has been listed on the New York Stock Exchange since 1922.
- Timken has 13 technical and engineering centers in North America, Europe and Asia.
- Timken has more than 66 plants and 105 sales offices, customer service centers and distribution centers in 27 countries on six continents.

TIMKEN SPHERICAL ROLLER BEARINGS

Timken spherical roller bearings exceed industry standards for superior quality and performance and are designed to manage high radial loads, even when misalignment, marginal lubrication, contamination, extreme speeds, or critical application stresses are present.

That's why industries such as power generation, oilfield, steel, aggregate, cement, mining and power transmission turn to Timken for a complete line of high-performance spherical roller bearings. Through expertly designed critical dimensions, such as roller and raceway contact geometry and topography, our spherical roller bearings are helping customers increase productivity by reducing downtime and extending maintenance cycles.

PRODUCT BREADTH

Timken offers a complete line of spherical roller bearing designs ranging from 25 to 1500 millimeter bore (0.98 to 59.06 inches). Included in this broad portfolio are two fundamental design types: the Type CJ style and Type YM/YMB design.

Available in 25 to 200 millimeter bore (0.98 to 7.87 inches), Type CJ-style bearings offer higher load ratings for longer life and incorporate a stamped steel window-type cage. Similar to all spherical roller bearings, the CJ design compensates for dynamic and static misalignment and allows customers to use weldments for housing frames instead of complex castings.

Type YM bearings feature precision-machined, roller-riding brass cages and are designed for harsh industrial environments. These bearings offer higher load ratings for longer life. For larger bore sizes, the Type YMB design incorporates an inner-ring, land-riding cage. The YM/YMB design is produced in sizes ranging from 30 to 1500 millimeter bore (1.18 to 59.06 inches).

In addition to the CJ and YM/YMB designs, Timken spherical roller bearings can be ordered with several enhancements and modifications to extend life and improve performance in specific applications. For example, large-bore spherical bearings sometimes operate below the bearing's published speed rating, causing the cage to push a non-rotating roller across the raceways. This sliding action breaks down lubrication film and can ultimately damage the bearing. To help protect the bearing components, our engineered surfaces coating minimizes skidding and sliding damage, while withstanding small-particle contamination. In some cases, engineered surfaces can extend bearing life by up to five times standard designs, especially in demanding applications like paper and rolling mills.

As a Timken customer, you receive an uncompromising standard of quality across the broadest range of bearings and related products. Brands like Timken, Torrington and Fafnir reflect an extensive line of tapered, needle, spherical, cylindrical, ball bearings and mounted units ideal for virtually every industrial application. Our core products are complemented by an ever-growing line of friction management solutions including lubricants, single-point lubricators, maintenance tools, safety equipment, condition monitoring systems and repair services that help keep operations running smoothly.

SAFETY END CAPS

These easily installed caps offer a high degree of protection to maintenance personnel as well as to the bearings integrated within a housing.

HOUSED UNITS

Ball and spherical roller bearing pillow block units, featuring a unique sealing design, are easily installed.

CONDITION MONITORING DEVICES

From wireless units to online systems, condition monitoring devices give you powerful diagnostic tools to help detect potential bearing problems, maximizing machine uptime and lowering maintenance costs.

SPHERICAL ROLLER BEARING METRIC ACCESSORIES

Bearing sleeves and locking devices, in a wide range of metric sizes, complement our line of Timken spherical roller bearings. These accessories are manufactured to the same quality standards as our bearings, helping to ensure a secure fit to straight and stepped shafts. Bearing sleeves are available in two distinct designs, assembled adapter sleeves and withdrawal sleeves, in sizes up to 900 mm.

LUBRICANTS

Our portfolio of lubricants includes lubricants developed by our tribology experts. These lubricants keep bearings running smoothly in a variety of industrial conditions, including high heat, food processing and high speed. Timken also offers a line of single-point lubricators to simplify the delivery of grease.

REPAIR AND REPLACEMENT OPTIONS

By choosing to have bearings and other elements remanufactured, customers save money in replacement costs and maintain a steady supply of parts instead of purchasing new parts during downtimes. Timken provides bearing repair services for any type of roller bearing design, regardless of manufacturer.

MAINTENANCE HANDLING TOOLS

Convenient handling devices give technicians the tools they need to install, remove and service bearings. Products include impact fitting tools, induction heaters and hydraulic pullers.

INDUSTRIAL SEALS

Timken industrial seals are available in small-bore sizes, zero- to 13-inches, as well as in metric and high-temperature varieties. We also provide tools to speed installation, deter seal and bearing damage and prevent premature seal leakage. The seals and tools can be applied in a full range of equipment used in thousands of applications, including manufacturing, off-highway, power transmission and oil refineries.

ABOUT THIS CATALOG

Timken offers an extensive range of bearings and accessories in both imperial and metric sizes. For your convenience, size ranges are indicated both in millimeters and inches. Contact your Timken sales representative to learn more about our complete line for the special needs of your application.

USING THIS CATALOG

We are committed to providing our customers with maximum service and quality. This catalog contains dimensions, tolerances and load ratings, as well as an engineering section describing fitting practices for shafts and housings, internal clearances, materials, and other bearing features. It can provide valuable assistance in the initial consideration of the type and characteristics of the bearing that may best suit your particular needs.

CATALOG FEATURES

Dimension and load rating data for the various types and styles of bearings is organized by size.

ISO, DIN, and ABMA, as used in this catalog, refer to the International Organization for Standardization, Deutsches Institut für Normung EV and the American Bearing Manufacturers Association.

TERMS AND CONDITIONS OF SALE

All products described in this catalog are sold subject to Timken's Terms and Conditions of Sale.

It is understood that the buyer, in selecting and ordering from this catalog, which supersedes all previous editions, accepts all Timken Terms and Conditions of Sale, a copy of which may be obtained by your Timken sales office.

Note: *Product performance is affected by many factors beyond the control of Timken. Therefore, the suitability and feasibility of all designs and product selection should be validated by you. This catalog is provided solely to give you, a customer of Timken or its parent or affiliates, analysis tools and data to assist you in your design. No warranty, expressed or implied, including any warranty of fitness for a particular purpose, is made by Timken. Timken products are sold subject to the Limited Warranty.*

WARNING

Failure to observe the following warnings could lead to a risk of serious bodily harm:

Proper maintenance and handling practices are critical. Failure to follow installation instructions and to maintain proper lubrication can result in equipment failure creating a risk of serious bodily harm. Never spin a bearing with compressed air. The rollers may be forcefully expelled creating a risk of serious bodily harm.

LIMITED WARRANTY

We warrant for a period of one year from the date of shipment that our products shall be free of defects in material and workmanship, as shall be determined by our manufacturing standards, and shall conform to the description on the face of this acknowledgment. THE WARRANTY DESCRIBED HEREIN SHALL BE IN LIEU OF ANY OTHER WARRANTY, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. The terms contained herein constitute the entire agreement of the parties and the warranty representations of the seller. There are no other representations, warranties, or guarantees applicable to the sale of our products unless otherwise expressly agreed to by us in writing.

SPECIAL APPLICATIONS

Some products, such as for aerospace applications, are made to special standards, and only the original equipment manufacturer can determine if a particular bearing is suitable for use in their equipment.

PURCHASER'S EXCLUSIVE REMEDY/ SELLER'S EXPRESS LIMIT OF LIABILITY

Purchaser's exclusive remedy for any warranty claim, or for any claim arising out of the purchase or use of our products, shall be the replacement of said products. We will replace our products, without charge to the purchaser, f.o.b. our point of shipment. We will not be liable for any consequential, incidental, or other damages sustained by purchaser, including but not limited to, loss of profits or revenue, loss of use of product, cost of capital, cost of substituted product, facilities, services, or claims of purchaser's customers for any damages. Any warranty claim of purchaser must be made within one year of the date of shipment of the product. This exclusive remedy applies regardless of the nature of purchaser's claim, whether in contract, tort, express or implied warranty, negligence or strict liability, upon which damages are claimed and regardless of whether the same is due to our negligence or any defect in our product.

ROLLER BEARINGS

TO IDENTIFY: SPHERICAL ROLLER BEARINGS

The basic bearing number, plus any applicable modification code, is marked on the outer ring face (e.g., 22315CJW33).

If the bearing has a tapered inner ring bore, the letter K is marked on the inner ring face (in addition to the above outer ring face marking).

Replacement bearings, if straight bore, should be ordered by specifying bearing number plus the suffix nomenclature marked on outside face (e.g., 22315CJW33).

Replacement bearings, if a tapered bore, should be ordered as described above, except include the suffix "K" following basic bearing number (e.g., 22315KCJW33).

Note: Letter symbols marked on recessed pads on ring faces are not part of bearing nomenclature and therefore not relevant to replacement bearing number identification.

For a comprehensive description of spherical roller bearing nomenclature, see page 76.

TO IDENTIFY: SPHERICAL ROLLER BEARING PILLOW BLOCK

The end cap and/or base housing is marked with a pillow block housing number (e.g., SAF517). The pillow block assembly number is closely affiliated with the housing number (e.g., SAF22517). Here, pillow block assembly uses the pillow block housing SAF517.

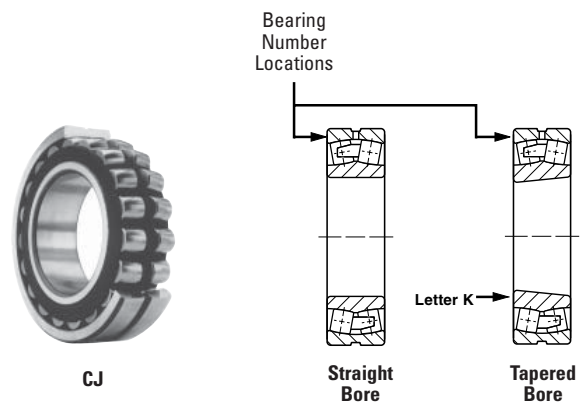

For a comprehensive description of spherical roller bearing pillow block nomenclature, see page 108.

HOW TO ORDER A REPLACEMENT BEARING

The ordering of correct replacement bearings is vital to minimizing downtime and ensuring the correct interchanges. Timken suggests that you follow these simple steps to identify your bearings and then proceed to the appropriate catalog section for the correct bearing catalog number. If no identification number is legible, measure the following dimensions:

1. Inner ring bore
2. Outer ring outside diameter
3. Inner width and outer width (not always the same dimension)
4. Shape of the outer ring: beveled vs. straight O.D.
5. List the unique features of the bearing or components such as: relubrication holes in the outer ring, wireloc (snap ring) groove in the outer ring O.D. Replacement and nomenclature information for Timken bearings is found under the "Introduction" section for each bearing type.

The term "modification code" refers to additional information, describing details and requirements, for specific bearing applications. A basic Timken bearing part number may be produced in a variety of special modifications to meet different application needs. The word "modification" in this context refers to all changes from standard for both commercial and non-commercial applications. This meaning is different from the term "modified for use in military applications" referred to in the ITAR regulations.

ENGINEERING

A

INTRODUCTION

Timken is a leader in the advancement of bearing technology. Expert craftsmanship, well-equipped production facilities, and a continuing investment in technology programs ensure that our products are synonymous with quality and reliability. Today, our plants manufacture thousands of bearing types and sizes to handle a wide range of application requirements.

Anti-friction bearings inherently manage broad ranges of speed and many combinations of radial and thrust loads. Environmental conditions such as low and high temperature, dust and dirt, moisture, and unusual mounting conditions, affect bearing operation.

If complex bearing applications are involved, consult your Timken representative.

ROLLER BEARING SELECTION PROCESS

Bearing selection is a process of evaluating the suitability of bearings for specific industrial applications. The quality of the available information to make these selections will play a major role in determining the success of the bearing choice.

The first step in bearing selection is identifying the proper roller element type, whether it is a ball, needle, cylindrical, spherical or tapered roller bearing. Each roller bearing type has advantages and disadvantages that are design-specific and will affect such things as the loads and speeds the bearing can sustain in the application.

Next, assess the size constraints of the bearing envelope or available space. This is done by considering the minimum shaft diameter, maximum housing bore and available width in the bearing application. After the bearing envelope is defined, search the catalog for bearings with bores, outer diameters and widths that will fit in the bearing envelope. There may be several bearings with different load-carrying capacities available that fit in the envelope.

Of the bearings fitting the envelope, the next step is to determine which of these bearings will give the desired life in the application by performing a bearing life analysis.

The bearing selection is completed once the design options are chosen. These options include cage type, cylindrical roller bearing flange arrangements, radial internal clearance or setting, and precision level and lubrication. These options are selected based on the application's speed, temperature, mounting and loading conditions, and will enable you to achieve optimum bearing performance and life.

This catalog assumes that a spherical roller bearing has been selected for the application, and highlights the data and methods to use during the selection process. For a closer look, your Timken representative can provide you with expert computer analysis to give you the most detailed information for your bearing application.

Table 1. Comparison of rolling element bearing types.

RADIAL SPHERICAL ROLLER BEARINGS

The principle styles of radial spherical roller bearings that Timken offers are: CJ, YM, YMD, and YMB.

Fig. 1. Common design styles of Timken spherical roller bearings.

YM bearings offer the greatest range of sizes in all series. They combine design experience with proven performance in many industries.

All of the newer styles (CJ, YM, YMB and YMD) offer higher load ratings for longer life. CJ bearings include a stamped steel, window style cage and are suitable for a broad range of general service applications. For extreme conditions of use, the YM, YMB and YMD styles with a machined brass cage should be considered.

All styles are available in straight or tapered bores. Tapered bore bearings can be ordered by placing a "K" immediately after the numbers in the bearing description (e.g., 22311KYM). Tapered bore bearings are available with adapter sleeve assemblies consisting of sleeve, locknut and washer. Adapter sleeve assemblies are designated SNW (e.g., SNW117).

Timken spherical roller bearings have been developed to accommodate radial and axial loads. The internal geometry allows the inner ring to accommodate misalignment. This capability is unique to spherical roller bearings, allowing machine designers more tolerance and less restrictive assembly. Other data is listed.

Timken spherical roller bearings are available in a ten dimensional series conforming to ISO and ANSI/ABMA standards. See Fig. 2 for size range illustration.

OPTIONAL FEATURES AVAILABLE WITH TIMKEN SPHERICAL ROLLER BEARINGS

W33 Lubrication Groove and Oil Holes

A lubrication groove and three oil holes are provided in the bearing outer ring. This eliminates the expense of machining a channel in the housing bore for introducing lubricant to the bearing. This design feature allows the lubricant to flow between the roller paths, through a single lubrication fitting. The lubricant moves laterally outward from the center of the bearing, reaching all contact surfaces and "flushing" the bearing. To order, add the suffix "W33" to the bearing number (e.g., 22216CJW33).

W22 Selected Outside Diameter Bearings

Bearings with selected outside diameters are required in some applications. Timken spherical roller bearings are available with reduced outside diameter tolerance. This allows a close control of the fit between the bearing and housing.

To specify this feature, add the suffix "W22" to the bearing number (e.g., 22216CJW22).

Additional features are available, consult your Timken representative for more information.

Fig. 2. Standard ISO/ABMA series available from Timken.

CAGE DESIGNS

Cages (sometimes referred to as rolling element separators or retainers) perform an important function in the proper operation of rolling bearings. They maintain uniform rolling element spacing in the races of the inner and outer rings of the bearings as the rolling elements pass into and out of the load zones. Timken has developed cage types to meet various service requirements. Temperature limitations are described in the temperature limitations portion of the Engineering section on page 70.

CAGE DESCRIPTIONS

Brass Cages

YM, YMB and YMD bearing cages are centrifugally cast and precision machined from brass. (Note that the brass grades used are often commercially termed bronze.) Their rugged construction provides an advantage in more severe applications. The open-end design permits lubricant to reach all surfaces easily, assuring ample lubrication and a cooler running bearing.

YM and YMB are both one-piece designs that are differentiated by their means of guidance within the bearing. With YM designs, the cage mass is low and the rollers are used for guidance, while YMB cage designs typically have more mass and guide on the inner ring.

YMD cages are similar to YMB, except they have a two-piece design. Two independent cages, one for each row of rollers, are assembled into an individual bearing. This allows each row of rollers to rotate independently when required by the application, and prevents bending of the cage fingers.

VCSM designs are similar to YM in that they are single piece, finger style cages.

Stamped Steel Cages

These cages are used in CJ design to permit extra load carrying capabilities in the bearing compared to YM and YMB designs. This is accomplished through the use of a window style cage, which retains the rollers axially thus eliminating the need for ribs on the inner ring and allowing longer rollers. The window style cage is also held on both ends as opposed to finger style cages, thus allowing thinner bridge sections and often more rollers.

The CJ design also has two independent cages, one for each row of rollers, assembled in an individual bearing. This feature serves to prevent cage bending when the operating environment is favorable for this to occur. Some CJ bearings utilize a cast iron floating ring to guide the cage. Use of the floating ring is based on size and mass of the cage.

The VCSJ design is a finger style cage, similar to the VCSM, however it is pressed steel instead of brass.

Pin Type Cages

Large diameter spherical roller bearings can be supplied with these cages. The design of pin type cages permits an increased roller complement, giving the bearing enhanced load carrying ability. Consult your Timken representative for suggestions on the application of this cage.

DETERMINATION OF APPLIED LOADS AND BEARING REACTIONS

The following equations are used to determine the forces developed by machine elements commonly encountered in bearing applications.

SUMMARY OF SYMBOLS USED TO DETERMINE APPLIED BEARING LOADS AND BEARING ANALYSIS

Symbol	Description	Units	Symbol	Description	Units
a_1	Reliability Life Factor		k	Centrifugal Force Constant	lbf/RPM ²
a_2	Material Life Factor		k_1	Bearing Torque Constant	
a_3	Operating Condition Life Factor		k_4, k_5, k_6	Dimensional Factor to calculate heat generation	
a_{3d}	Debris Life Factor		L	Lead Axial Advance of a Helix for One Complete Revolution	mm, in.
a_{3k}	Load Zone Life Factor		L	Distance between bearing geometric center lines	mm, in.
a_{3l}	Lubrication Life Factor		m	Gearing Ratio	
a_{3m}	Misalignment Life Factor		M	Bearing Operating Torque or Moment	N-m, N-mm, lb-in.
a_{3p}	Low Load Life Factor		n	Bearing Operating Speed or General Term for Speed	rot/min, RPM
a_e	Effective Bearing Spread	mm, in.	n_G	Gear Operating Speed (RPM)	rot/min, RPM
b	Tooth Length	mm, in.	n_P	Pinion Operating Speed (RPM)	rot/min, RPM
c_1, c_2	Linear Distance (positive or negative)	mm, in.	n_W	Worm Operating Speed (RPM)	rot/min, RPM
C	Dynamic Radial Load Rating	N, lbf	N_G	Number of Teeth in the Gear	
C_0	Static Load Rating	N, lbf	N_P	Number of Teeth in the Pinion	
C_p	Specific Heat of Lubricant	J/(kg x °C), BTU/(lb x °F)	N_S	Number of Teeth in the Sprocket	
d	Bearing bore diameter	mm, in.	P_0	Static Equivalent Load	N, lbf
d_0	Mean inner race diameter	mm, in.	P_{0a}	Static Equivalent Thrust (Axial) Load	N, lbf
d_c	Distance Between Gear Centers	mm, in.	P_{0r}	Static Equivalent Radial Load	N, lbf
d_m	Mean Bearing Diameter	mm, in.	P_r	Dynamic Equivalent Radial Load	N, lbf
d_s	Shaft inside diameter	mm, in.	Q	Generated Heat or Heat Dissipation Rate	W, BTU/min
D	Bearing outside diameter	mm, in.	T	Torque	N-m, lb.-in.
D_0	Mean outer race diameter	mm, in.	v	Vertical (used as subscript)	
D_h	Housing outside diameter	mm, in.	V	Linear Velocity or Speed	km/h, mph
D_m	Mean Diameter or Effective Working Diameter of a Sprocket, Pulley, Wheel or Tire	mm, in.	V_r	Rolling or Surface Velocity	m/s, fpm
D_{mG}	Mean or Effective Working Diameter of the Gear	mm, in.	X	Dynamic Radial Load Factor	
D_{mP}	Effective Working Diameter of the Pinion	mm, in.	X_0	Static Radial Load Factor	
D_{mW}	Effective Working Diameter of the Worm	mm, in.	Y	Dynamic Thrust (Axial) Load Factor	
D^{pG}	Pitch Diameter of the Gear	mm, in.	Y_0	Static Thrust (Axial) Load Factor	
D^{pP}	Pitch Diameter of the Pinion	mm, in.	Y_G	Bevel Gearing – Gear Pitch Angle	deg.
D^{pW}	Pitch Diameter of the Worm	mm, in.	Y_P	Hypoid Gearing – Gear Root Angle	deg.
e	Life Exponent		Y_P	Bevel Gearing – Pinion Pitch Angle	deg.
f	Lubricant Flow Rate	L/min, U.S. pt/min	α	Hypoid Gearing – Pinion Face Angle	deg.
f_0	Viscous Dependent Torque Coefficient			Coefficient of linear expansion	mm/mm/°C, in./in./°F
f_1	Load Dependent Torque Coefficient		δ_s	Interference fit of inner race on shaft	mm, in.
f_B	Belt or Chain Pull Factor		δ_h	Interference fit of outer race in housing	mm, in.
F	General Term for Force	N, lbf	η	Efficiency, Decimal Fraction	
F_a	Applied Thrust (Axial) Load	N, lbf	$\theta_1, \theta_2, \theta_3$	Gear Mesh Angles Relative to the Reference Plane	deg.
F_a^G	Thrust Force on Gear	N, lbf	θ_i, θ_o	Oil inlet or outlet temperature	°C, °F
F_a^P	Thrust Force on Pinion	N, lbf	λ	Worm Gear Lead Angle	deg.
F_a^W	Thrust Force on Worm	N, lbf	μ	Coefficient of Friction	
F_b^W	Belt or Chain Pull	N, lbf	ν	Lubricant Kinematic Viscosity	cSt
F_c	Centrifugal Force	N, lbf	σ_0	Approximate Maximum Contact Stress	MPa, psi
F_r	Applied Radial Load	N, lbf	Φ_G	Normal Tooth Pressure Angle for the Gear	deg.
F_s^G	Separating Force on Gear	N, lbf	Φ_P	Normal Tooth Pressure Angle for the Pinion	deg.
F_s^P	Separating Force on Pinion	N, lbf	Ψ_G	Helix (Helical) or Spiral Angle for the Gear	deg.
F_s^W	Separating Force on Worm	N, lbf	Ψ_P	Helix (Helical) or Spiral Angle for the Pinion	deg.
F_{te}	Tractive Effort on Vehicle Wheels	N, lbf	ΔT	Temperature difference between shaft/inner race + rollers and housing/bearing outer race	°C, °F
F_t^G	Tangential Force on Gear	N, lbf	ρ	Lubricant Density	kg/m ³ , lb/ft ³
F_t^P	Tangential Force on Pinion	N, lbf			
F_t^W	Tangential Force on Worm	N, lbf			
F_W	Force of Unbalance	N, lbf			
h	Horizontal (used as subscript)				
H	Power (kW or hp)	kW, hp			

Table 2.

DETERMINATION OF APPLIED LOADS AND BEARING REACTIONS - continued

GEARING

Spur Gearing (Fig. 4)

Tangential Force:

$$F_{tG} = \frac{(1.91 \times 10^7) H}{D_{pG} n_G} \text{ (newtons)}$$

$$= \frac{(1.26 \times 10^5) H}{D_{pG} n_G} \text{ (pounds-force)}$$

Separating Force:

$$F_{sG} = F_{tG} \tan \phi_G$$

Single Helical Gearing (Fig. 5)

Tangential Force:

$$F_{tG} = \frac{(1.91 \times 10^7) H}{D_{pG} n_G} \text{ (newtons)}$$

$$= \frac{(1.26 \times 10^5) H}{D_{pG} n_G} \text{ (pounds-force)}$$

Separating Force:

$$F_{sG} = \frac{F_{tG} \tan \phi_G}{\cos \psi_G}$$

Thrust Force:

$$F_{aG} = F_{tG} \tan \psi_G$$

Straight Bevel and Zerol Gearing with Zero Degrees Spiral

In straight bevel and zerol gearing, the gear forces tend to push the pinion and gear out of mesh, such that the direction of the thrust and separating forces are always the same regardless of direction of rotation. (Fig. 6) In calculating the tangential force, (\$F_{tP}\$ or \$F_{tG}\$), for bevel gearing, the pinion or gear mean diameter, (\$D_{mP}\$ or \$D_{mG}\$), is used instead of the pitch diameter, (\$D_{pP}\$ or \$D_{pG}\$). The mean diameter is calculated as follows:

$$D_{mG} = D_{pG} - b \sin \gamma_G \text{ or } D_{mP} = D_{pP} - b \sin \gamma_P$$

In straight bevel and zerol gearing

$$F_{tP} = F_{tG}$$

Fig. 8. Spiral bevel and hypoid gears – the direction of thrust and separating forces depends upon spiral angle, hand of spiral, direction of rotation, and whether the gear is driving or driven.

Spiral Bevel and Hypoid Gearing

In spiral bevel and hypoid gearing, the direction of the thrust and separating forces depends upon spiral angle, hand of spiral, direction of rotation, and whether the gear is driving or driven (see Table 3). The hand of the spiral is determined by noting whether the tooth curvature on the near face of the gear (Fig. 8) inclines to the left or right from the shaft axis. Direction of rotation is determined by viewing toward the gear or pinion apex.

In spiral bevel gearing:

$$F_{tP} = F_{tG}$$

In hypoid gearing:

$$F_{tP} = \frac{F_{tG} \cos \psi_P}{\cos \psi_G}$$

Hypoid pinion effective working diameter:

$$D_{mP} = D_{mG} \left(\frac{N_P}{N_G} \right) \left(\frac{\cos \psi_G}{\cos \psi_P} \right)$$

Worm**

Tangential Force:

$$F_{tW} = \frac{(1.91 \times 10^7) H}{D_{mW} n_W} \text{ (newtons)}$$

$$= \frac{(1.26 \times 10^5) H}{D_{mW} n_W} \text{ (pounds-force)}$$

Thrust Force:

$$F_{aW} = 0.98 F_{tG}$$

*Use this value for F_{tG} for bearing loading calculations on worm gear shaft. For torque calculations, use the following F_{tG} equations.

Separating Force:

$$F_{sW} = \frac{0.98 F_{tG} \tan \Phi}{\cos \lambda}$$

Worm Gear:

Tangential Force:

$$F_{tG} = \frac{(1.91 \times 10^7) H m \eta}{D_{pG} n_W} \text{ (newtons)}$$

$$= \frac{(1.26 \times 10^5) H m \eta}{D_{pG} n_W} \text{ (pounds-force)}$$

or

$$F_{tG} = \frac{(1.91 \times 10^7) H \eta}{D_{pG} n_G} \text{ (newtons)}$$

$$= \frac{(1.26 \times 10^5) H \eta}{D_{pG} n_G} \text{ (pounds-force)}$$

**Use this value for calculating torque in subsequent gears and shafts. For bearing loading calculations, use the equation for F_{aW} .

Thrust Force:

$$F_{aG} = \frac{(1.91 \times 10^7) H}{D_{mW} n_W} \text{ (newtons)}$$

$$= \frac{(1.26 \times 10^5) H}{D_{mW} n_W} \text{ (pounds-force)}$$

Separating Force:

$$F_{sG} = \frac{0.98 F_{tG} \tan \Phi}{\cos \lambda}$$

Where:

η = efficiency (refer to manufacturer's catalog)

$$D_{mW} = 2d_c - 0.98 D_{pG}$$

Lead angle at center of worm:

$$\lambda = \tan^{-1} \left(\frac{D_{pG}}{m D_{pW}} \right) \quad \text{or} \quad = \tan^{-1} \left(\frac{L}{\pi D_{pW}} \right)$$

DETERMINATION OF APPLIED LOADS AND BEARING REACTIONS - *continued*

BELT AND CHAIN DRIVE FACTORS

Due to variations of belt tightness as set by various operators, an exact equation relating total belt pull to tension F_1 on the tight side and tension F_2 on the slack side, Fig. 11, is difficult to establish. The following equation and Table 4 may be used to estimate the total pull from various types of belts and pulley, and chain and sprocket designs.

$$F_b = \frac{(1.91 \times 10^7) H f_B}{D_m n} \quad (\text{newtons})$$

$$= \frac{(1.26 \times 10^5) H f_B}{D_m n} \quad (\text{pounds-force})$$

Standard roller chain sprocket mean diameter:

$$D_m = \frac{P}{\sin\left(\frac{180}{N_s}\right)}$$

Fig. 11. Belt or chain drive.

Type	f_B
Chains, single	1.00
Chains, double	1.25
"V" belts.....	1.50

Table 4. Belt or chain pull factor based on 180 degrees angle of wrap.

SHOCK LOADS

It is difficult to determine the exact effect that shock loading has on bearing life. The magnitude of the shock load depends on the masses of the colliding bodies, their velocities, and deformations at impact.

The effect on the bearing depends on how much of the shock is absorbed between the point of impact and the bearings, as well as whether the shock load is great enough to cause bearing failure. It also is dependent on frequency and duration of shock loads.

As a minimum, a suddenly applied load is equivalent to twice its static value. It may be considerably more than this, depending on the velocity of impact.

Shock involves a number of variables that generally are not known or easily determined. Therefore, it is good practice to rely on experience. Timken has years of experience with many types of equipment under the most severe loading conditions. Your Timken representative should be consulted on any application involving unusual loading or service requirements.

CENTRIFUGAL FORCE

Centrifugal force resulting from imbalance in a rotating member:

$$F_c = \frac{F_w r n^2}{8.94 \times 10^5} \quad (\text{newtons})$$

$$= \frac{F_w r n^2}{3.52 \times 10^4} \quad (\text{pounds-force})$$

TRACTIVE EFFORT AND WHEEL SPEED

The relationships of tractive effort, power, wheel speed and vehicle speed are:

$$H = \frac{F_{te} V}{3600} \quad (\text{for } H \text{ in kilowatts, } V \text{ in kilometers per hour and } F_{te} \text{ in Newtons})$$

$$H = \frac{F_{te} V}{375} \quad (\text{for } H \text{ in horsepower, } V \text{ in miles per hour and } F_{te} \text{ in pounds})$$

and

$$n = \frac{5300V}{D_m} \quad (\text{for } n \text{ in revolutions per minute, } V \text{ in kilometers per hour and } D_m \text{ in millimeters})$$

$$n = \frac{336V}{D_m} \quad (\text{for } n \text{ in revolutions per minute, } V \text{ in miles per hour and } D_m \text{ in inches})$$

DETERMINATION OF APPLIED LOADS AND BEARING REACTIONS - *continued*

BEARING REACTIONS

To allow for misalignment between the shaft and housing axes, a spherical roller bearing is self-aligning. That is, the effective center for each row of rollers intersects the shaft axis at the bearing geometric center as shown in Fig. 12. As the distance between effective centers for each row of a bearing is zero (i.e. zero moment arm), a pure couple cannot be generated internal to the bearing. Therefore, when a shaft and housing are misaligned, the inner and outer rings of the bearing rotate up to a few degrees relative to each other, without creating internal forces. This self-aligning capability in turn prevents an external moment load from being supported by the bearing. Therefore, spherical roller bearings can only accommodate external shaft and housing loads through radial and axial reaction forces.

Typically, one bearing on a shaft system is fixed axially and reacts radial and axial forces. The other bearings on the shaft are usually mounted with loose fits and axial space to allow movement, or float, for environmental conditions such as uneven thermal growth between the shaft and housing. Fig. 12 shows a common two bearing-shaft system where one bearing is free to move axially (float position) and cannot accommodate axial loading, while the other bearing is constrained axially (fixed position) and reacts the axial and radial applied loading.

Fig. 12. Typical mounting configuration for spherical roller bearings showing the position of effective load carrying centers.

SHAFT ON TWO SUPPORTS

Simple beam equations are used to translate the externally applied forces on a shaft into bearing reactions acting at the bearing effective centers. Following is an example calculation for a shaft with two spherical roller bearings supporting a single helical gear.

Shown are equations for the case of a shaft on two supports with gear forces F_t (tangential), F_s (separating), and F_a (thrust), an external radial load F , and an external moment M . The loads are applied at arbitrary angles (θ_1, θ_2 , and θ_3) relative to the reference plane indicated in Fig. 13. Using the principle of superposition, the equations for vertical and horizontal reactions (F_{rv} and F_{rh}) can be expanded to include any number of gears, external forces or moments. Use signs as determined from gear force equation.

SHAFT ON THREE OR MORE SUPPORTS

The equations of static equilibrium are insufficient to solve bearing reactions on a shaft having more than two supports. Such cases can be solved using computer programs if adequate information is available.

In such problems, the deflections of the shaft, bearings and housings affect the distribution of loads. Any variance in these parameters can significantly affect bearing reactions.

DETERMINATION OF APPLIED LOADS AND BEARING REACTIONS - *continued*

Symbol	Description	Units
a_e	Distance between bearing effective centers	mm, in.
A, B	Bearing position, used as subscripts	
c_1, c_2	Linear distance (positive or negative)	mm, in.
F	Applied force	N, lbf
F_r	Radial bearing load	N, lbf
F_a	Axial bearing load	N, lbf
h	Horizontal (used as subscript)	
H	Power	kW, hp
M	Moment	N-mm, lbf. in.
v	Vertical (used as subscript)	
$\theta_1, \theta_2, \theta_3$	Gear mesh, applied force and moment angles respectively, relative to plane of reference defined in Fig. 13	degree

Table 5. Symbols used in calculation examples.

Bearing radial loads are determined by:

1. Resolving forces applied to the shaft into horizontal and vertical components, relative to a convenient reference plane.
2. Taking moments about the opposite support.
3. Combining the horizontal and vertical reactions at each support into one resultant load.

Vertical reaction component at bearing position:

$$F_{rBv} = \frac{1}{a_e} \left[c_1 (F_{sG} \cos \theta_1 + F_{tG} \sin \theta_1) + \frac{1}{2} (D_{pG} - b \sin \gamma_G) F_{aG} \cos \theta_1 + c_2 F \cos \theta_2 + M \cos \theta_3 \right]$$

Horizontal reaction component at bearing position:

$$F_{rBh} = \frac{1}{a_e} \left[c_1 (F_{sG} \sin \theta_1 - F_{tG} \cos \theta_1) + \frac{1}{2} (D_{pG} - b \sin \gamma_G) F_{aG} \sin \theta_1 + c_2 F \sin \theta_2 + M \sin \theta_3 \right]$$

Vertical reaction component at bearing position A:

$$F_{rAv} = F_{sG} \cos \theta_1 + F_{tG} \sin \theta_1 + F \cos \theta_2 - F_{rBv}$$

Horizontal reaction component at bearing position A:

$$F_{rAh} = F_{sG} \sin \theta_1 - F_{tG} \cos \theta_1 + F \sin \theta_2 - F_{rBh}$$

Resultant radial reaction:

$$F_{rA} = (F_{rAv}^2 + F_{rAh}^2)^{1/2}$$

$$F_{rB} = (F_{rBv}^2 + F_{rBh}^2)^{1/2}$$

Resultant axial reaction:

$$F_{aA} = F_{aG} \text{ (fixed position)}$$

$$F_{aB} = 0 \text{ (float position)}$$

Fig. 13. Bearing radial reactions.

LOAD RATINGS, EQUIVALENT LOADS AND BEARING LIFE

The basic dynamic load rating and the static load rating are commonly used for bearing selection. The basic dynamic load rating is used to estimate the life of a rotating bearing. Static load ratings are used to determine the maximum permissible load that can be applied to a non-rotating bearing.

The basic philosophy of Timken is to provide the most realistic bearing rating to assist our customers in the bearing selection process. Published ratings for Timken bearings include the basic dynamic radial load rating C_r . This value is based on a basic rating life of one million revolutions. The basic static radial load rating is C_0 .

STATIC EQUIVALENT LOADS

The static equivalent load rating is based on an assumed nominal clearance in both rows of rollers within the bearing, which equates to a load zone of approximately 130°. The static equivalent load is the radial load that will result in the same maximum contact stress as the applied bearing load. The load factors X_0 and Y_0 are used with the following equation to estimate the static radial equivalent load. The values of X_0 (always equal to 1 for SRBs) and Y_0 are listed in the bearing tables.

$$P_{0r} = X_0 F_r + Y_0 F_a$$

STATIC LOAD RATING

The basic static radial load rating and thrust load rating for Timken bearings are based on a maximum contact stress within a non-rotating bearing of 4000 MPa (580 ksi) at the center of contact on the most heavily loaded roller.

The 4000 MPa (580 ksi) stress levels may cause visible light Brinell marks on the bearing raceways. This degree of marking will not have a measurable effect on fatigue life when the bearing is subsequently rotating under a lower application load. If sound, vibration or torque is critical, or if a pronounced shock load is present, a lower load limit should be applied. For more information on selecting a bearing for static load conditions, consult your Timken representative.

MAXIMUM CONTACT STRESS

For all spherical roller bearings, the maximum contact stress can be approximated using the static equivalent load and the static rating.

$$\sigma_0 = 4000 \cdot \left(\frac{P_0}{C_0} \right)^{1/2} \text{ MPa}$$

$$\sigma_0 = 580 \cdot \left(\frac{P_0}{C_0} \right)^{1/2} \text{ ksi}$$

Where:

- σ_0 = maximum contact stress
- P_0 = radial equivalent load
- C_0 = static load rating

EQUIVALENT DYNAMIC RADIAL BEARING LOADS (P_r)

The basic dynamic radial load rating, C_r , is assumed to be the radial load carrying capacity with a 180° load zone in the bearing. The dynamic equivalent radial load is defined as a single radial load that, if applied to the bearing, will result in the same life as the combined loading under which the bearing operates.

To calculate the L_{10} life, it is necessary to calculate a dynamic equivalent radial load, designated by P_r .

$$P_r = X F_r + Y F_a$$

Where:

- P_r = Dynamic Equivalent Radial Load
- F_r = Applied Radial Load
- F_a = Applied Axial Load
- X = Dynamic Radial Load Factor
- Y = Dynamic Axial Load Factor

For spherical roller bearings, the values of X and Y are dependent on the amount of the axial load. Calculate the ratio of the axial load to the radial load. Compare this ratio to the e value for the bearing. Note that values for e, X, and Y are available in the bearing tables.

LOAD RATINGS, EQUIVALENT LOADS AND BEARING LIFE- *continued*

MINIMUM BEARING LOAD

Slippage can occur if loads are too light and can cause damage to the bearings. The minimum load for radial spherical roller bearings is $P_r/C_1 = 0.04$ (P_r is the dynamic equivalent radial load and C_1 , the basic dynamic load rating).

BEARING LIFE

Many different performance criteria exist that dictate how a bearing should be selected. These include bearing fatigue life, rotational precision, power requirements, temperature limits, speed capabilities, sound, etc. This section deals primarily with bearing life as related to material-associated fatigue. Bearing life is defined as the length of time, or number of revolutions, until a fatigue spall of 6 mm² (0.01 in.²) develops. Since metal fatigue is a statistical phenomenon, the life of an individual bearing is impossible to precisely predetermine. Bearings that may appear to be identical can exhibit considerable life scatter when tested under identical conditions. Thus it is necessary to base life predictions on a statistical evaluation of a large number of bearings operating under similar conditions. The Weibull distribution function is commonly used to predict life of a population of bearings

RATING LIFE

Rating life (L_{10}) is the life that 90 percent of a group of apparently identical bearings will complete or exceed before a fatigue spall develops. The L_{10} life also is associated with 90 percent reliability for a single bearing under a certain load.

BEARING LIFE EQUATIONS

Traditionally, the L_{10} life has been calculated as follows for bearings under radial or combined loading where the dynamic equivalent radial load (P_r) has been determined:

$$L_{10} = \left(\frac{C_1}{P_r} \right)^{10/3} (1 \times 10^6) \text{ (revolutions)}$$

or,

$$L_{10} = \left(\frac{C_1}{P_r} \right)^{10/3} \left(\frac{1 \times 10^6}{60n} \right) \text{ (hours)}$$

With increased emphasis on the relationship between the reference conditions and the actual environment in which the bearing operates in the machine, the traditional life equations have been expanded to include certain additional variables that affect bearing performance. The approach whereby these factors are considered in the bearing analysis and selection, has been termed Bearing Systems Analysis (BSA).

The ISO/ABMA expanded bearing life equation is:

$$L_{10a} = a_1 a_2 a_3 L_{10}$$

Where:

a_1 = Reliability Life Factor

a_2 = Material Life Factor

a_3 = Operating Condition Life Factor (to be specified by the manufacturer)

The Timken expanded bearing life equation is:

$$L_{10a} = a_1 a_2 a_{3d} a_{3k} a_{3l} a_{3m} a_{3p} \left(\frac{C_1}{P_r} \right)^{10/3} (1 \times 10^6)$$

Where:

a_1 = Reliability Life Factor

a_2 = Material Life Factor

a_{3d} = Debris Life Factor

a_{3k} = Load Zone Life Factor

a_{3l} = Lubrication Life Factor

a_{3m} = Misalignment Life Factor

a_{3p} = Low Load Life Factor

LOAD RATINGS, EQUIVALENT LOADS AND BEARING LIFE- *continued*

RELIABILITY LIFE FACTOR (a_1)

The equation for the life adjustment factor for reliability is:

$$a_1 = 4.26 \left(\ln \frac{100}{R} \right)^{2/3} + 0.05$$

ln = natural logarithm (base e)

To adjust the calculated L_{10} life for reliability, multiply by the a_1 factor. If 90 (90 percent reliability) is substituted for R in the above equation, $a_1 = 1$. For R = 99 (99 percent reliability), $a_1 = 0.25$. Table 6 lists the reliability factor for commonly used reliability values.

R (percent)	L_n	a_1
90	L_{10}	1.00
95	L_5	0.64
96	L_4	0.55
97	L_3	0.47
98	L_2	0.37
99	L_1	0.25
99.5	$L_{0.5}$	0.175
99.9	$L_{0.1}$	0.093

Table 6. Reliability life factor.

Note that the equation for reliability adjustment assumes there is a short minimum life below which the probability of bearing damage is minimal (e.g., zero probability of bearing damage producing a short life). Extensive bearing fatigue life testing has shown the minimum life, below which the probability of bearing damage is negligible, can be larger than shown above. For a more accurate prediction of bearing lives at high levels of reliability, consult your Timken representative.

MATERIAL LIFE FACTOR (a_2)

The life adjustment factor for bearing material (a_2) for standard Timken bearings manufactured from bearing quality steel is 1.0. Bearings also are manufactured from premium steels, containing fewer and smaller inclusion impurities than standard steels and providing the benefit of extending bearing fatigue life (e.g., Duraspexx™). Application of the material life factor requires that fatigue life is limited by nonmetallic inclusions, contact stresses are approximately less than 2400 Mpa (350 ksi), and adequate lubrication is provided. It is important to note that improvements in material cannot offset poor lubrication in an operating bearing system. Consult your Timken representative for applicability of the material factor.

DEBRIS LIFE FACTOR (a_{3d})

Debris in a lubrication system reduces the life of a roller bearing by creating indentations on the contacting surfaces, leading to stress risers. The Timken life rating equations were developed based on test data obtained with 40 μm oil filtration and measured ISO cleanliness levels of approximately 15/12, which is typical of cleanliness levels found in normal industrial machinery. When more or less debris is present within the system, the fatigue life predictions can be adjusted according to the measured or expected lubricant cleanliness level to more accurately reflect the expected bearing performance.

As opposed to determining the debris life factor based on filtration and cleanliness levels, a Debris Signature Analysis™ can be performed for more accurate bearing performance predictions. The Debris Signature Analysis is a process for determining the effects of the actual debris present in your system on the bearing performance. The typical way this occurs is through measurements of dented/bruised surfaces on actual bearings run in a given application. This type of analysis can be beneficial because different types of debris cause differing levels of performance, even when they are of the same size and amount in the lubricant. Soft, ductile particles can cause less performance degradation than hard, brittle particles. Hard, ductile particles are typically most detrimental to bearing life. Brittle particles can break down, thus not affecting performance to as large a degree as hard, ductile particles. For more information on Debris Signature Analysis or the availability of debris resistant bearings for your application, consult your Timken representative.

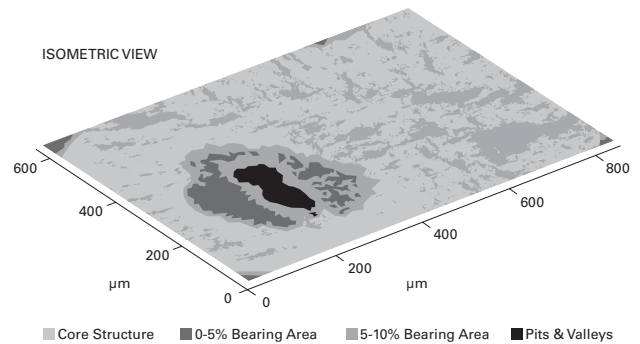

Fig. 14. Surface map of a debris dented bearing raceway.

LOAD RATINGS, EQUIVALENT LOADS AND BEARING LIFE- *continued*

LOAD ZONE LIFE FACTOR (a_{3k})

The fatigue life of a bearing is a function of the stresses in rollers and raceways and the number of stress cycles that the loaded bearing surfaces experience in one bearing revolution. The stresses depend on applied load and on how many rollers support that load. The number of stress cycles depends on bearing geometry and on how many rollers support the load. Therefore, life for a given external load is related to the loaded arc, or load zone, of the bearing.

The load zone in a bearing is dominated by the internal clearance, either radial or axial depending on the bearing type. Neglecting preload, less clearance in a bearing results in a larger load zone and subsequently longer bearing life.

Fig. 15. Bearing load zones and roller-raceway contact loading.

Using the dynamic equivalent load (P_r) instead of the applied radial load (F_r) in the equation for L_{10a} roughly approximates the load zone factor for combined loading only. If a more accurate assessment of the load zone adjusted life is necessary (e.g., including the effects of internal clearance or fitting practice), consult your Timken representative.

LUBRICATION LIFE FACTOR (a_{3l})

The influence of lubrication film due to elastohydrodynamic (EHL) lubrication on bearing performance is related to the reduction or prevention of asperity (metal-metal) contact between the bearing surfaces. Extensive testing has been done at the Timken Technology Center to quantify the effects of the lubrication-related parameters on bearing life. It has been found that the roller and raceway surface finish, relative to lubricant film thickness, has the most notable effect on improving bearing performance. Factors such as bearing geometry, material, loads and load zones also play an important role in bearing performance.

The following equation provides a method to calculate the lubrication factor for a more accurate prediction of the influence of lubrication on bearing life (L_{10a}).

$$a_{3l} = C_g \cdot C_l \cdot C_s \cdot C_v \cdot C_{gr}$$

Where:

C_g = geometry factor

C_l = load factor

C_s = speed factor

C_v = viscosity factor

C_{gr} = grease lubrication factor

Note: The a_{3l} maximum is 2.88 for all bearings. The a_{3l} minimum is 0.200 for case carburized bearings and 0.126 for through hardened bearings.

A lubricant contamination factor is not included in the lubrication factor because Timken endurance tests are typically run with a 40 μm filter to provide a realistic level of lubricant cleanliness for most applications.

GEOMETRY FACTOR (C_g)

C_g is given for most part numbers in the bearing tables. The geometry factor also includes the material effects and load zone considerations, as these also are inherent to the bearing design. However, it should be noted that the primary effect of the load zone is on roller load distributions and contact stresses within the bearing, which are not quantified in the lubrication factor. Refer to the previous section Load Zone Life Factor (a_{3k}) for more information.

Note that the geometry factor (C_g) factor is not applicable to our Duraspexx™ product. For more information on our Duraspexx™ product, consult your Timken representative.

A

LOAD RATINGS, EQUIVALENT LOADS AND BEARING LIFE- *continued*

LOAD FACTOR (C_l)

The C_l factor is obtained from Fig. 16. The equivalent dynamic radial load (P_r) applied to the bearing is shown in newtons and is determined in the equivalent bearing loads (P_e) section.

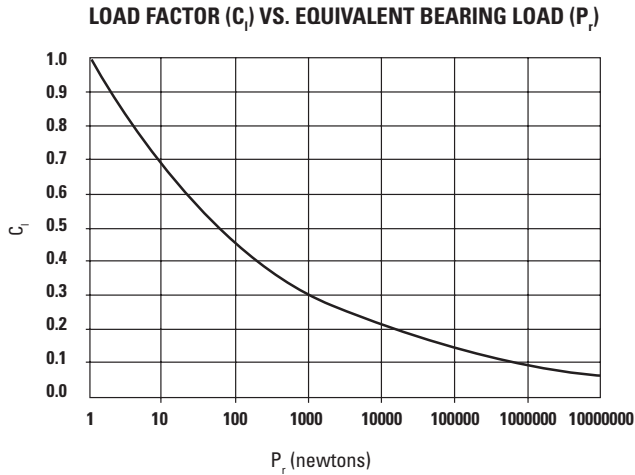

Fig. 16. Load factor for estimation of the lubricant-life adjustment.

VISCOSITY FACTOR (C_v)

The lubricant kinematic viscosity [centistokes (cSt)] is taken at the operating temperature of the bearing. The operating viscosity can be estimated by using Fig. 22 in the lubrication section. The viscosity factor (C_v) can then be determined from Fig. 18.

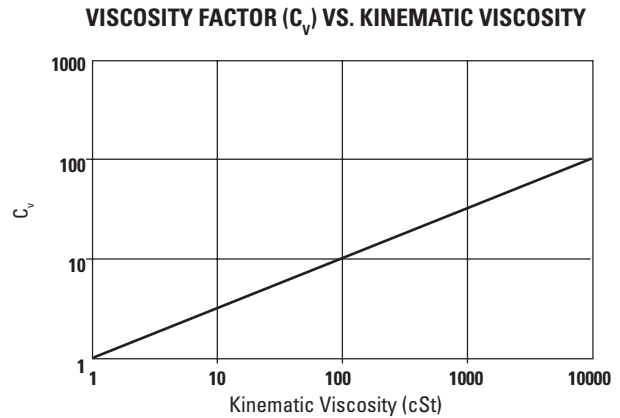

Fig. 18. Viscosity factor for estimation of the lubricant-life adjustment.

SPEED FACTOR (C_s)

C_s is determined from Fig. 17, where rev/min (RPM) is the rotational speed of the inner ring relative to the outer ring.

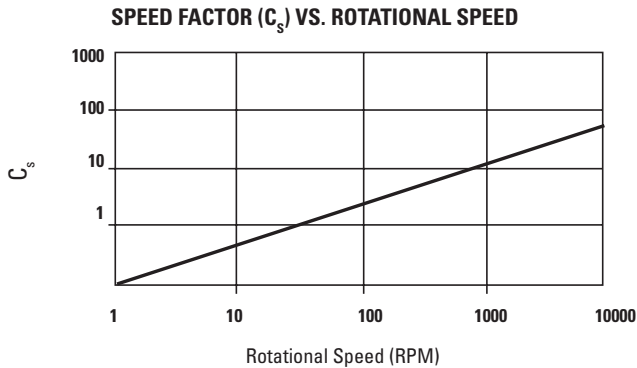

Fig. 17. Speed factor for estimation of the lubricant-life adjustment.

LOAD RATINGS, EQUIVALENT LOADS AND BEARING LIFE- *continued*

GREASE LUBRICATION FACTOR (C_{gr})

For grease lubrication, the EHL lubrication film becomes depleted of oil over time and is reduced in thickness. Consequently, a reduction factor (C_{gr}) should be used to adjust for this effect.

$$C_{gr} = 0.79$$

MISALIGNMENT LIFE FACTOR (a_{3m})

The effect of bearing life depends on the magnitude of the angle of misalignment, internal bearing geometry and the applied loads.

The misalignment life factor for spherical bearings is equal to one, $a_{3m} = 1$, due to its self-aligning capabilities. The allowable misalignment in a spherical roller bearing is between 1 degree and 2.5 degrees, depending upon the series of the bearing as detailed in Table 7. Life will be reduced if these limits are exceeded due to roller-raceway contact truncation.

MAXIMUM PERMISSIBLE MISALIGNMENTS FOR SPHERICAL ROLLER BEARINGS BASED ON SERIES

Bearing Series	Maximum Misalignment
238	±1.0°
222, 230, 231, 239, 249	±1.5°
223, 240	±2.0°
232, 241	±2.5°

Table 7. Maximum permissible misalignments for spherical roller bearings based on series.

LOW-LOAD LIFE FACTOR (a_{3p})

Bearing life tests at the Timken Technology Center have shown greatly extended bearing fatigue life performance is achievable when the bearing contact stresses are low and the lubricant film is sufficient to fully separate the micro-scale textures of the contacting surfaces. Mating the test data with sophisticated computer programs for predicting bearing performance, Timken engineers have developed a low-load factor for use in the catalog to predict the life increase expected when operating under low bearing loads. Fig. 19 shows the low-load factor (a_{3p}) as a function of the lubricant life factor (a_{3l}) and the ratio of bearing dynamic rating to the bearing equivalent load.

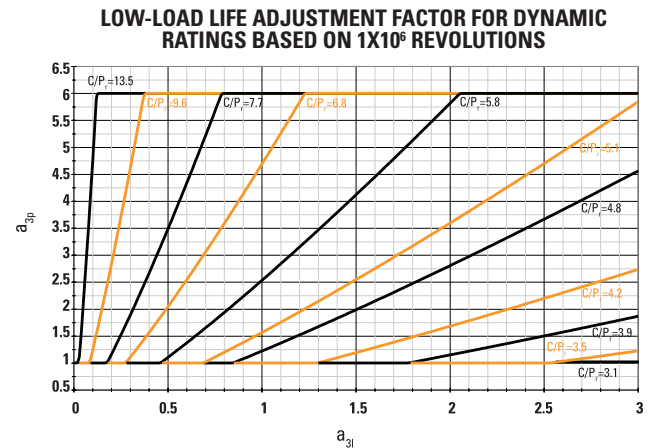

Fig. 19. Low-load life adjustment factor.

TOLERANCES

Depending on your specific application requirements, various degrees of bearing accuracy may be required.

Timken maintains close control of race contours and internal clearances, accuracy of cage construction, and unusually fine surface finishes. These standards, coupled with proprietary design, material and processing specifications, ensure that our bearings

are designed for performance. Among the tolerance classes, Normal or otherwise referred to as P0 (RBEC 1) applies to spherical roller bearings for normal usage. The other classes, P6 and P5 (RBEC 3 and 5) apply to spherical roller bearings of increased precision as required. The values associated with the spherical roller bearing precision classes are listed in Tables 8 and 9.

Table 8. Standard tolerances for spherical roller bearing inner rings.

The tolerances in this table are in conformance with ISO492:2002.

ISO Symbols - Inner Ring

- Δdmp Single plane mean bore diameter deviation from basic bore diameter. For a basically tapered bore, Δdmp refers only to the theoretical small bore end of the bore
- K_{ia} Radial runout of assembled bearing inner ring, with respect to outer ring
- V_{BS} Inner ring width variation
- S_d Inner ring face runout with respect to bore
- S_{ia} Axial runout of assembled bearing inner ring, with respect to outer ring
- ΔB_s Single inner ring width deviation from basic, e.g., width tolerance

ISO Symbols - Outer Ring

- ΔDmp Single plane mean outside diameter deviation from basic outside diameter, e.g., O.D. tolerance
- K_{oa} Radial runout of assembled bearing outer ring, with respect to inner ring
- V_{CS} Outer ring width variation
- S_D Outer ring face runout with respect to outer diameter
- S_{oa} Axial runout of assembled bearing outer ring, with respect to inner ring
- ΔC_s Outer ring width deviation from basic, e.g., width tolerance

MOUNTING DESIGNS

Correct bearing mounting and fitting practices are key components of proper bearing setting. Setting is the amount of clearance or interference within a mounted bearing. Bearing internal clearance is affected by the tightness of the fit to the inner and outer races. Proper bearing setting is crucial to bearing life and performance. Although clearance is required for most mounted bearings, application dependent factors include load, speed, bearing position, installation method, materials of construction, runout accuracy, thermal considerations, hoop stress, and shaft and housing design. This section provides tables and discussion to aid in selection of the proper bearing mounting and fitting procedures to optimize performance in general applications. For special applications, please consult your Timken representative.

RADIAL INTERNAL CLEARANCE (RIC)

Timken bearing RIC allows a tight fit, with sufficient internal clearance after installation for normal operating conditions. Table 11 lists the standard RIC ranges for Timken spherical roller bearings with cylindrical and tapered bores.

Spherical roller bearings with tapered bore (K) require a slightly greater interference fit on the shaft than a cylindrical bore bearing. The effect of this greater interference fit is a reduction of RIC. For tapered bore bearings, it is critical to select the RIC that allows for this reduction.

Several factors influence RIC reduction. Inner rings pressed into solid steel shafts expand approximately 80 percent of the interference fit. Outer rings pressed into steel or cast iron housings reduce RIC by about 60 percent of the interference fit. For RIC reduction on hollow shafts or non-steel materials consult your local Timken representative.

Timken bearings are supplied with NORMAL RIC, unless otherwise specified. The desired RIC code must be added to the bearing number, FOLLOWING ALL OTHER SUFFIXES.

Min./Max. values for each RIC are shown in the two adjacent columns directly beneath the selected RIC. Each single column represents a boundary between adjacent RICs. For example, the minimum values shown for C5 are also the maximum values for C4; minimum values for C4 are also the maximum values for C3, etc.

BEARING ENDPLAY

In certain applications such as vane pumps, rubber mill rotor shafts or where it is necessary to take up axial expansion within the bearing, knowledge of the bearing endplay relationship to mounted radial internal clearance may be required. Table 10 shows the ratio of approximate endplay to radial internal clearance in spherical roller bearings.

Example: 22320CJW33C3 bearing has a radial internal clearance of .002 after installation. The total endplay would be approximately .0086 in. ($\pm .0043$ from center).

Series	Endplay RIC
39	8.7
30	7.0
22	5.5
31	5.0
40	4.8
32	4.4
23	4.3
41	4.2
33	3.9

Table 10. Ratio of approximate endplay-to-RIC for Timken spherical roller bearings.

Table 11.

⁽¹⁾For bearings with normal initial clearance.

For bearings with normal initial clearance.

Min./Max. values for each RIC are shown in the two adjacent columns directly beneath the selected RIC. Each single column represents a boundary between adjacent RIC's. For example, the maximum values shown for C5 are also the maximum values for C4; minimum values for C4 are also the maximum values for C3; etc.

NOTE: Special clearances can be provided (C6, C7, etc.)

MOUNTING DESIGNS - *continued*

EXAMPLE #1 – Calculating RIC Reduction Using a Spherical Roller Bearing with Tapered Bore

Given bearing number 22328K C3 (140 mm bore with C3 clearance) is to be mounted on a tapered shaft. Using a set of feeler gauges, RIC is found to be –

$$\text{RIC} = 0.178 \text{ mm (0.007 in.)}$$

Suggested Reduction of RIC Due to Installation = 0.064 to 0.089 mm (0.0025 in. to 0.0035 in.), found in chart on page 51.

Calculate the clearance after mounting –

$$0.178 \text{ mm} - 0.076 \text{ mm} = 0.102 \text{ mm } \textit{or}$$

$$0.007 \text{ in.} - 0.003 \text{ in.} = 0.004 \text{ in.}$$

Note: For this example, the value of 0.076 mm (0.003 in.) was obtained by taking the mid-range value of the upper and lower limits found in the table on page 51.

Therefore, the locknut should be tightened until RIC reaches 0.102 mm (0.004 in.).

It should also be noted that the value obtained by reading the Suggested RIC after Installation directly from the table is 0.056 mm (0.0022 in.). This differs from the value calculated in the above example. The value taken directly from the table is provided as a minimum value. It is not suggested to use a calculated value that falls below this minimum.

Mounting spherical roller bearing.

MOUNTING DESIGNS - *continued*

EXAMPLE #2 – Calculating RIC Reduction Using a Spherical Roller Bearing with Cylindrical Bore

Observations:

- Bearing 22230YM, nominal 150 mm (5.0955 in.) bore and 270 mm (10.6299 in.) O.D., standard class, operating at 1200 RPM.
- Float bearing position so the stationary O.D. should be free to move in housing, or loose fit.
- With shaft/inner ring rotation and the moderate loading 0.09C, the bore should be tight fit.

We can use the nominal fit charts on page 55 (Shaft Fit) and 56 (Housing Fit) to help guide our ISO fit selection.

Shaft Fit (page 55) at 150 mm Bore: ISO p6

From the shaft fit chart at 150 mm nominal bore at p6 (page 40), the shaft tolerance is Nominal +0.043 to +0.068 mm (+0.0017 to +0.0027 in.). Therefore we have the following bore range:

Max. Shaft = 150.068 mm (5.0955 in.)

Min. Shaft = 150.043 mm (5.0945 in.)

This yields a Shaft Fit:

$$\begin{aligned} \text{Min. Fit} &= \text{Min. Shaft} - \text{Max. Bore} \\ &= 150.043 - 150.000 = 0.043 \text{ mm (0.0017 in.) Tight} \end{aligned}$$

$$\begin{aligned} \text{Max. Fit} &= \text{Max. Shaft} - \text{Min. Bore} \\ &= 150.068 - 149.075 = 0.093 \text{ mm (0.0037 in.) Tight} \end{aligned}$$

Housing Fit (page 56) at 270 mm O.D.: ISO H8

From the housing fit chart at 270 mm nominal O.D. at H8 (page 43), the housing bore tolerance is Nominal +0.000 to +0.081 mm (+0.0000 in., +0.0032 in.). Therefore we have the following bore range:

Max. Housing Bore = 270.081 mm (10.6331 in.)

Min. Housing Bore = 270.000 mm (10.6299 in.)

This yields an O.D. Fit:

$$\begin{aligned} \text{Min. Fit} &= \text{Min. Housing Bore} - \text{Max. O.D.} = 270.000 - 270.000 \\ &= 0.000 \text{ mm (0.0000 in.) Loose} \end{aligned}$$

$$\begin{aligned} \text{Max. Fit} &= \text{Max. Housing Bore} - \text{Min O.D.} = 270.081 - 269.965 \\ &= 0.116 \text{ mm (0.0046 in.) Loose} \end{aligned}$$

DETERMINING PROPER RIC

For the primary selection of radial internal clearance, RIC, the major parameters are the bearing speed and the fits. For our example, we know that the shaft fit is 0.043 mm (0.0017 in.) tight to 0.093 mm (0.0037 in.) tight. We know the housing fit is line to 0.116 mm (0.0046 in.) loose. We also know that the bearing speed is 1200 RPM or 60 percent of the speed rating.

As a general rule of thumb, we bump the clearance up due to operating speeds that exceed 70% of the speed rating, due to concerns over internal heat generation and thermal growth. In this case, we are at 60 percent of the speed rating, so normal clearance, ISO C0 or C_{Normal} can be selected.

Observing the RIC chart on page 51, we find for 150 mm nominal bore at C_{Normal} the RIC will be 0.110 mm to 0.170 mm (0.0043 in. to 0.0067 in.). We also note that the minimum recommended RIC (installed) is 0.056 mm (0.0022 in.).

Also from page 51, we note that we get an approximate reduction of RIC that is 80 percent of interference fit on a solid shaft and 60 percent of the OD interference fit in a steel or cast iron housing. Since we have a loose housing fit, there will be no RIC reduction from that fit.

Shaft Fit RIC Reductions and Clearance:

$$0.043 \text{ mm (0.0017 in.) tight} = 0.034 \text{ mm (0.0014 in.) RIC reduction}$$

$$0.093 \text{ mm (0.0037 in.) tight} = 0.074 \text{ mm (0.0030 in.) RIC reduction}$$

$$\begin{aligned} \text{Max. Clearance} &= \text{Max. RIC} - \text{Min. Fit Reduction} \\ &= 0.170 - 0.034 = 0.136 \text{ mm (0.0054 in.)} \end{aligned}$$

$$\begin{aligned} \text{Min. Clearance} &= \text{Min. RIC} - \text{Max. Fit Reduction} \\ &= 0.110 - 0.074 = 0.036 \text{ mm (0.0014 in.)} \end{aligned}$$

Since the minimum mounted clearance is less than the minimum suggested RIC of 0.056 mm (0.0022 in.), the C_{Normal} RIC clearance limit needs to be re-evaluated.

For a 150mm nominal bore at C3, the RIC will be 0.170 to 0.220 mm (0.0067 to 0.0087 in.). Recalculating shaft fit RIC reduction and clearance:

$$\begin{aligned} \text{Max. Clearance} &= \text{Max. RIC} - \text{Min. Fit Reduction} \\ &= 0.220 - 0.034 = 0.186 \text{ mm (0.0073 in.)} \end{aligned}$$

$$\begin{aligned} \text{Min. Clearance} &= \text{Min. RIC} - \text{Max. Fit Reduction} \\ &= 0.170 - 0.074 = 0.096 \text{ mm (0.0038 in.)} \end{aligned}$$

Since the Minimum mounted clearance is now greater than the minimum suggested RIC of 0.056 mm (0.0022 in.), the C3 RIC clearance limit is acceptable.

MOUNTING DESIGNS - continued

BEARING SHAFT AND HOUSING SEATS

Geometry

Under load, spherical roller bearings typically conform to the shape of the shaft and housing seats into which they are mounted. For example, seats of inner rings and/or outer rings that are machined out of round will cause the bearing rings to take this form and therefore impart error motion into the shaft. Therefore, the shaft and housing seats should be machined to at least the same precision as the bearing bore and O.D. respectively. Tolerances for the bearing bore and O.D. are listed in Tables 8 and 9.

SURFACE FINISHES – STANDARD BEARINGS

For industrial applications, please refer to the following guidelines:

Ground Shafts

All roller bearing shaft seats should be ground to a surface finish of 1.6 μm (65 μin) Ra maximum wherever possible.

Turned Shafts

When shaft seats are turned, a tighter fit should be used. In this case, the shaft diameter should be turned to a finish of 3.2 μm (125 μin) Ra maximum.

Housing Bores

Housing bores should be finished to 3.2 μm (125 μin) Ra maximum.

SHAFT AND HOUSING FITS

Fig. 20 is a graphical representation of shaft and housing fit selection for these bearings conforming to ANSI/ABMA standard 7. The bars designated by g6, h6 etc., represent shaft/housing diameter and tolerance ranges to achieve various loose and interference fits required for various load and ring rotation conditions.

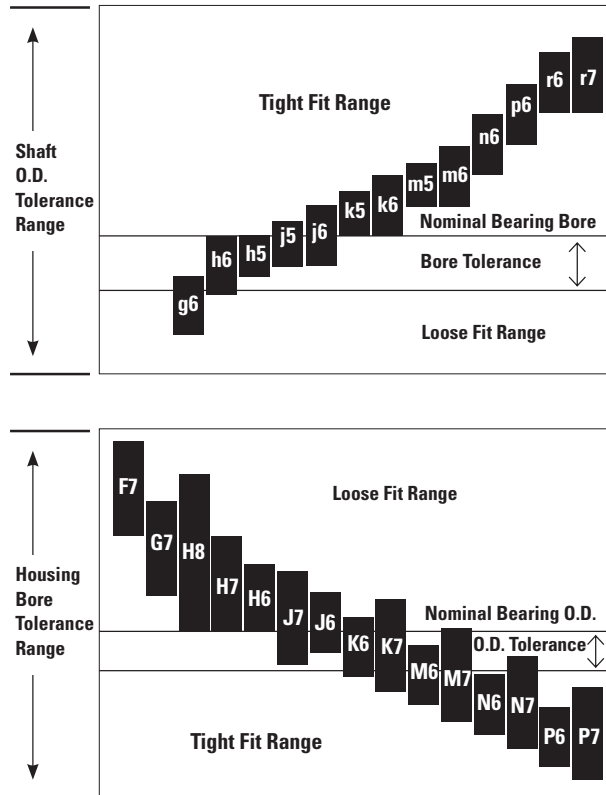

Fig. 20. Graphical representation of shaft and housing fits.

FITTING PRACTICES

s4 FITS

A centrifugal force load produces a rotating outer ring load and a stationary inner ring load, even though the inner ring rotates. This makes it desirable to fit the outer ring tight in the housing (using a P6 fit as shown on pages 34-49), and the inner ring loose on the shaft using an s4 fit as listed in the table. The standard W33 bearing with oil groove and oil holes can be used.

HOLLOW SHAFTS

In case of a thin section hollow shaft, the fits mentioned in the tables for industrial applications should be increased to avoid possible inner ring creeping under some load conditions. Consult your Timken representative for more information.

Note: The s4 fit designation as referenced on this page is a special fit tolerance developed by The Timken Company for this specific application. It DOES NOT conform to ISO standards similarly published as s4 preferred shaft fits.

s4 FITS					
Data shown in thousandths of a millimeter (15=0.015 mm) or ten-thousandths of an inch (6=.0006"). See dimensional tables for nominal bore.

SHAFT AND HOUSING FITS

Radial Spherical Roller Bearings

These charts are guidelines for specifying shaft and housing fits related to particular operating conditions.

HOUSING					
Conditions		Examples	Tolerance Symbol ⁽¹⁾	Remarks	
One-piece bearing housing	Rotating outer ring load	Variable load direction	Two-bearing eccentric shaft mechanism	P6	The outer ring is not displaceable axially
		Heavy loads on bearings in thin walled housings	Supporting wheels in cranes, wheel hubs, crank bearings	P7	
		Normal and heavy loads	Wheel hubs, crank bearings	N7	
		Light and variable loads	Conveyor rollers, rope sheaves, tension pulleys	M7	
Split or one-piece bearing housing	Indeterminate load direction	Heavy shock loads	Electrical traction motors	K7	The outer ring is, as a rule, not displaceable axially.
		Heavy and normal loads, axial displacement of outer ring not required	Electrical motors, pumps, crankshaft main bearings		
Split or one-piece bearing housing	Stationary outer ring load	Normal and light loads, axial displacement of the outer ring desirable	Electrical motors, pumps, crankshaft main bearings	J7	The outer ring is, as a rule, displaceable axially.
		Shock loads, temporarily complete unloading.	Journal boxes for rail vehicles	H7	
		All loads	Bearing applications in general, journal boxes for rail vehicles		
		Normal and light loads, loads under simple operating conditions	Line shaftings	H8	
One-piece bearing housing	Applications requiring particular accuracy	Heat supplied through the shaft	Dryer cylinders	G7	The outer ring is easily displaced axially.
		Very accurate running and small deflections under variable loads	For main spindles in machine tools	M6 N6 P6	
		Very accurate running under light loads and indeterminate load direction	Held bearings in high speed centrifugal force compressors	K6	
		Very accurate running, axial displacement of outer ring desirable	Floating bearings in high speed centrifugal force compressors	J6	

Table 14. Suggested housing fitting practice for spherical roller bearings.

⁽¹⁾ Cast iron or steel housing. For numerical values see tables on pages 42-49.

For housings of aluminum / magnesium , tolerances generally are selected which give a slightly tighter fit than those given in the table.

NON FERROUS HOUSINGS

Care should be taken when pressing outer rings into aluminum or magnesium housings to avoid metal pick up. This may result in unsatisfactory fits, backing, and alignment from debris trapped between the outer rings and backing shoulder. Preferably, the outer rings should be cooled or the housing heated, or both, during assembly. Also, a special lubricant may be used to ease assembly. In some cases, outer rings are mounted in steel inserts that are attached to the aluminum or magnesium housings. Table fits may then be used. Consult your Timken representative for more information.

CAUTION: Failure to use the specified fits may result in improper bearing setting. Reduced bearing performance or malfunction may occur. This may cause damage to machinery in which the bearing is a component. If interference fits are either greater or less than those specified, the mounted bearing setting will be other than intended.

LUBRICATION AND SEALS

LUBRICATION

To help maintain a rolling bearing's anti-friction characteristics, lubrication is needed to:

- Minimize rolling resistance due to deformation of the rolling elements and raceway under load by separating the mating surfaces.
- Minimize sliding friction occurring between rolling elements, raceways and cage.
- Transfer heat (with oil lubrication).
- Protect from corrosion and, with grease lubrication, from contaminant ingress.

Modern lubricants do this very effectively, although in many applications the means by which they accomplish this are extremely complex and not completely understood. Because the principles involved with lubricating rolling element bearings are complex and do not have to be known to employ lubricants successfully, this discussion will stress the practical rather than the theoretical aspects of lubrication.

LUBRICATION SELECTION

The wide range of bearing types and operating conditions precludes any simple, all-inclusive statement or guideline for the selection of the proper lubricant. At the design level, the first consideration is whether oil or grease is best for the particular operation. The advantages of oil and grease are outlined in the table below. When heat must be carried away from the bearing, oil must be used. It is nearly always preferred for very high speed applications. For speed ratings of grease and oil-lubricated bearings, refer to the section entitled "Speed, Heat and Torque."

ADVANTAGES OF OIL AND GREASE	
OIL	GREASE
Carries heat away from the bearings	Simplifies seal design and acts as a sealant
Carries away moisture and particulate matter	Permits prelubrication of sealed or shielded bearings
Easily controlled lubrication	Generally requires less frequent lubrication

Table 15.

LUBRICANT ADDITIVES

Additives are materials, usually chemicals, that improve specific properties when added to lubricants. Additives, when properly formulated into a lubricant, can increase lubricant life, provide greater resistance to corrosion, increase load-carrying capacity and enhance other properties. Additives are very complex and should not be added indiscriminately to lubricants as a cure-all for lubrication problems.

The more common lubricant additives include:

- Oxidation inhibitors for increasing lubricant service life.
- Rust or corrosion inhibitors to protect surfaces from rust or corrosion.

- Demulsifiers to promote oil and water separation.
- Viscosity-index improvers to decrease viscosity sensitivity to temperature change.
- Pour-point depressants to lower the pouring point at low temperatures.
- Lubricity agents to modify friction.
- Antiwear agents to retard wear.
- Extreme pressure (EP) additives to prevent scoring under boundary-lubrication conditions.
- Detergents and dispersants to maintain cleanliness.
- Antifoam agents to reduce foam.
- Tackiness agents to improve adhesive properties.

Inorganic additives such as molybdenum disulphide, graphite, and zinc oxide are sometimes included in lubricants. In most roller bearing applications, inorganic additives are of no significant benefit; conversely, as long as the concentration is low and the particle size small, they are not harmful.

Recently, the effects of lubricant chemistry on bearing life (as opposed to the purely physical characteristics) have received much emphasis. Rust, oxidation, extreme pressure and anti-wear additive packages are widely used in engine and gear oils. Fatigue testing has shown these additives may, depending on their chemical formulation, concentration and operating temperature, have a positive or negative impact on bearing life.

Consult your Timken representative for more information regarding lubricant additives.

GUIDANCE FOR OIL/GREASE SELECTION

Oil Lubrication

Oils used for bearing lubrication should be high-quality, non-oxidizing mineral oils or synthetic oils with similar properties. Selection of the proper type of oils depends on bearing speed, load, operating temperature and method of lubrication.

Some features and advantages of oil lubrication, in addition to the above, are as follows:

- Oil is a better lubricant for high speeds or high temperatures. It can be cooled to help reduce bearing temperature.
- With oil, it is easier to handle and control the amount of lubricant reaching the bearing. It is harder to retain in the bearing. Lubricant losses may be higher than with grease.
- As a liquid, oil can be introduced to the bearing in many ways, such as drip-feed, wick-feed, pressurized circulating systems, oil-bath or air-oil mist. Each is suited to certain types of applications.
- Oil is easier to keep clean for recirculating systems.
- Oil may be introduced to the bearing housing in many ways.

LUBRICATION AND SEALS - *continued*

The most common systems are:

- **Oil Bath.**

The housing is designed to provide a sump through which the rolling elements of the bearing will pass. Generally, the oil level should be no higher than the center point of the lowest rolling element. If speed is high, lower oil levels should be used to reduce churning. Gages or controlled elevation drains are used to achieve and maintain the proper oil level.

- **Circulating System.**

This system has the advantages of:

- An adequate supply of oil for both cooling and lubrication.
- Metered control of the quantity of oil delivered to each bearing.
- Removal of contaminants and moisture from the bearing by flushing action.
- Suitability for multiple bearing installations.
- Large reservoir, which reduces deterioration. Increased lubricant life provides economic efficiency.
- Incorporation of oil filtering devices.
- Positive control to deliver the lubricant where needed.

A typical circulating oil system consists of an oil reservoir, pump, piping and filter. A cooler may be required.

- **Oil-Mist Lubrication.**

Oil-mist lubrication systems are used in high-speed, continuous operation applications. This system permits close control of the amount of lubricant reaching the bearings. The oil may be metered, atomized by compressed air and mixed with air, or it may be picked up from a reservoir using a venturi effect. In any case, the air is filtered and supplied under sufficient pressure to assure adequate lubrication of the bearings. Control of this type of lubrication system is accomplished by monitoring the operating temperatures of the bearings being lubricated. The continuous passage of the pressurized air and oil through the labyrinth seals used in the system prevents the entrance of contaminants from the atmosphere to the system.

The successful operation of this type of system is based upon the following factors: proper location of the lubricant entry ports in relation to the bearings being lubricated, avoidance of excessive pressure drops across void spaces within the system, the proper air pressure and oil quantity ratio to suit the particular application, and the adequate exhaust of the air-oil mist after lubrication has been accomplished. To ensure "wetting" of the bearings and to prevent possible damage to the rolling elements and races, it is imperative that the oil mist system be turned on for several minutes before the equipment is started. The importance of "wetting" the bearing before starting cannot be overstated and has particular significance for equipment that has been idled for extended periods of time.

OIL LUBRICATION GUIDELINES

Oil Lubrication

Lubricating oils are commercially available in many forms for automotive, industrial, aircraft and other uses. Oils are classified as either petroleum types (refined from crude oil) or synthetic types (produced by chemical synthesis).

Petroleum Oils

Petroleum oils are used for nearly all oil-lubricated applications of Timken bearings. These oils have physical and chemical properties that can help in the selection of the correct oil for any bearing application.

Synthetic Oils

Synthetic oils cover a broad range of categories and include polyalphaolefins, silicones, polyglycols, and various esters. In general, synthetic oils are less prone to oxidation and can operate at extreme hot or cold temperatures. Physical properties, such as pressure-viscosity coefficients, tend to vary between oil types and caution should be used when making oil selections.

The polyalphaolefins (PAO) have a hydrocarbon chemistry, which parallels petroleum oil both in their chemical structures and pressure-viscosity coefficients. Therefore, PAO oil is mostly used in the oil-lubricated applications of Timken bearings when severe temperature environments (hot and cold) are encountered or when extended lubricant life is required. The silicone, ester and polyglycol oils have an oxygen based chemistry that is structurally quite different from petroleum oils and PAO oils. This difference has a profound effect on its physical properties where pressure-viscosity coefficients can be lower compared to mineral and PAO oils. This means that these types of synthetic oils may actually generate a smaller EHD film thickness than a mineral or PAO oil of equal viscosity at operating temperature. Reductions in bearing fatigue life and increases in bearing wear could result from this reduction of lubricant film thickness.

Selection of Oils

The selection of oil viscosity for any bearing application requires consideration of several factors: load, speed, internal clearance, type of oil, and environmental factors. Since viscosity varies inversely with temperature, a viscosity value must always be stated with the temperature at which it was determined. High viscosity oil is used for low-speed or high-ambient temperature applications. Low viscosity oil is used for high-speed or low-ambient temperature applications.

LUBRICATION AND SEALS - *continued*

CLASSIFICATION

There are several classifications of oils based on viscosity grades. The most familiar are the Society of Automotive Engineers (SAE) classifications for automotive engine and gear oils. The American Society for Testing and Materials (ASTM) and the International Organization for Standardization (ISO) have adopted standard viscosity grades for industrial fluids. Fig. 21 shows the viscosity comparisons of ISO/ASTM with SAE classification systems at 40° C (104° F).

Fig. 21. Viscosity classification comparison between ISO/ASTM grades (ISO 3448/ASTM D2442) and SAE grades (SAE J 300-80 for crankcase oils, SAE J 306-81 for axle and manual transmission oils).

TEMPERATURE VS. KINEMATIC VISCOSITY

Fig. 22. This figure can be used to predict the oil's kinematic viscosity versus temperature (use base oil for grease).

TYPICAL OIL LUBRICATION GUIDELINES

In this section, the properties and characteristics of lubricants for typical roller bearing applications are listed. These general characteristics have resulted from long, successful performance in these applications.

General Purpose Rust and Oxidation Lubricating Oil

General purpose rust and oxidation (R&O) inhibited oils are the most common type of industrial lubricant. They are used to lubricate Timken bearings in all types of industrial applications where conditions requiring special considerations do not exist.

SUGGESTED GENERAL PURPOSE R&O LUBRICATING OIL PROPERTIES	
Base stock	Solvent refined, high viscosity-index petroleum oil
Additives	Corrosion and oxidation inhibitors
Viscosity index	80 min.
Pour point	-10° C (14° F) max.
Viscosity grades	ISO/ ASTM 32 through 220

Table 16.

Some low-speed and/or high-ambient temperature applications require the higher viscosity grades, and high-speed and/or low-temperature applications require the lower viscosity grades.

INDUSTRIAL EXTREME PRESSURE (EP) GEAR OIL

Extreme pressure gear oils are used to lubricate Timken bearings in all types of heavily loaded industrial equipment. They should be capable of withstanding heavy loads including abnormal shock loads common in heavy-duty equipment.

SUGGESTED INDUSTRIAL EP GEAR OIL PROPERTIES	
Base stock	Solvent refined, high viscosity index petroleum oil
Additives	Corrosion and oxidation inhibitors. Extreme pressure (EP) additive* - 15.8 kg (35 lb) min. "OK" Timken load rating
Viscosity index	80 Min.
Pour point	-10° C (14° F) Max.
Viscosity grades	ISO/ ASTM 100, 150, 220, 320, 460

* ASTM D 2782

Table 17.

Industrial EP gear oils should be composed of a highly refined petroleum oil-based stock plus appropriate inhibitors and additives. They should not contain materials that are corrosive or abrasive to bearings. The inhibitors should provide long-term protection from oxidation and protect the bearing from corrosion in the presence of moisture. The oils should resist foaming in service and have good water separation properties. An EP additive protects against scoring under boundary-lubrication conditions. The viscosity grades suggested represent a wide range. High temperature and/or slow-speed applications generally require the higher viscosity grades. Low temperatures and/or high speeds require the use of lower viscosity grades.

A LUBRICATION AND SEALS - *continued*

LUBRICATING GREASES

Definition

According to the ASTM definition, lubricating grease is a “solid to semi-fluid product of the dispersion of a thickening agent in a liquid lubricant; other ingredients imparting special properties may be included.” If this definition were applied in the manner a chemist would use to illustrate a chemical reaction, the composition of a grease could be described by the formula below.

Fluids	+Thickening Agents	+Special Ingredients	=Lubricating Grease
Mineral Oils	Soaps	Oxidation Inhibitors	
Esters	Lithium, Sodium	Rust Inhibitors	
Organic Esters	Barium, Calcium	VI Improver	
Glycols	Strontium	Tackiness	
Silicones	Non-Soap (Inorganic)	Perfumes	
	Microgel (Clay)	Dyes	
	Carbon Black	Metal Deactivator	
	Silica-gel		
	Non-Soap (Organic)		
	Urea compounds		
	Terephthlamate		
	Organic Dyes		

Table 18.

At this time, there is no known universal anti-friction bearing grease. Each individual grease has certain limiting properties and characteristics.

Synthetic lubricating fluids, such as esters, organic esters and silicones, are used with conventional thickeners or chemical additives to provide greases capable of performing over an extremely wide range of temperatures, from as low as -73° C (-100° F) to a high of 288° C (550° F).

The successful use of lubricating grease in roller bearings depends on the physical and chemical properties of the lubricant pertaining to the bearing, its application, installation and general environmental factors. Because the choice of a lubricating grease for a particular bearing under certain service conditions is often difficult to make, your Timken representative should be consulted for proper suggestions.

Grease Lubrication

The simplest lubrication system for any bearing application is grease. Conventionally, greases used in Timken bearing applications are petroleum oils of some specific viscosity that are thickened to the desired consistency by some form of metallic soap. Greases are available in many soap types such as sodium, calcium, lithium, calcium-complex and aluminium-complex. Organic and inorganic type non-soap thickeners also are used in some products.

Soap Type

Calcium greases have good water resistance. Sodium greases generally have good stability and will operate at higher temperatures, but they absorb water and cannot be used where moisture is present. Lithium, calcium-complex and aluminium-complex greases generally combine the higher temperature properties and stability of sodium grease with the water resistance of calcium grease. These greases are often referred to as multi-purpose greases since they combine the two most important lubricant advantages into one product.

Characteristics and Operating Environments

Listed below are the general characteristics of prominent roller bearing greases.

Thickener	Typical Dropping PT		Usable** Temperature		Typical Water Resistance
	C	F	C	F	
Sodium Soap	260+	500+	121	250	Poor
Lithium Soap	193	380	104	220	Good
Polyurea	238	460	149	300	Excellent
Lithium Complex Soap	260+	500+	163	325	Good

Table 19.

NOTE: The properties of a grease may vary considerably depending on the particular oil, thickener and additives used in the formulation.

** Continuous operation with no relubrication. Depending upon the formulation the service limits may vary. The usable limit can be extended significantly with relubrication.

Polyurea as a thickener for lubricating fluids is one of the most significant lubrication developments in more than 30 years. Polyurea grease performance in a wide range of bearing applications is outstanding, and in a relatively short time it has gained acceptance as a factory-packed lubricant for ball bearings.

Consistency

Greases may vary in consistency from semifluids hardly thicker than a viscous oil, to solid grades almost as hard as a soft wood.

Consistency is measured by a penetrometer, in which a standard weighted cone is dropped into the grease. The distance the cone penetrates (measured in tenths of a millimeter in a specific time) is the penetration number.

The National Lubricating Grease Institute (N.L.G.I.) classification of grease consistency is shown below:

NLGI Grease Grades	Penetration Number
0	355-385
1	310-340
2	265-295
3	220-250
4	175-205
5	130-160
6	85-115

Table 20.

Grease consistency is not fixed; it normally becomes softer when sheared or “worked.” In the laboratory this “working” is accomplished by forcing a perforated plate up and down through a closed container of grease. This “working” does not compare with the violent shearing action that takes place in a ball bearing and does not necessarily correlate with actual performance.

LUBRICATION AND SEALS - *continued*

Low Temperatures

Starting torque in a grease-lubricated bearing at low temperatures can be critical. Some greases may function adequately as long as the bearing is operating, but resistance to initial movement is such that the starting torque is excessive. In certain smaller machines, starting is an impossibility when very cold. Under such operating circumstances, the greases containing low-temperature characteristic oils are generally required.

If the operating temperature range is wide, synthetic fluid greases offer definite advantages. Greases are available to provide very low starting and running torque at temperatures as low as -73° C (-100° F). In certain instances, these greases perform better in this respect than oil.

An important point concerning lubricating greases is that the starting torque is not necessarily a function of the consistency or the channel properties of the grease. It appears to be more a function of the individual properties of the particular grease and is difficult to measure. Experience alone will indicate whether one grease is superior to another.

High Temperatures

The high temperature limit for modern grease is generally a function of the thermal and oxidation stability of the fluid and the effectiveness of the oxidation inhibitors. Fig. 23 was prepared using military-specification greases to illustrate the thermal limitations of mineral oil, ester, silicone, and fluorinated ether greases. The limits as shown apply only to prelubricated bearings or to applications where relubrication is not possible. Where provisions have been made for relubrication, the temperature limits may be extended provided the interval between cycles is reduced accordingly.

A rule of thumb, developed from years of testing grease-lubricated bearings, indicates that grease life is halved for every 10° C (18° F) increase in temperature. For example, if a particular grease is providing 2000 hours of life at 90° C (194° F) raising the temperature to 100° C (212° F) reduction in life to approximately 1000 hours would result. On the other hand, 4000 hours could be expected by lowering the temperature to 80° C (176° F).

It becomes obvious that the reactions started by the normal reaction of lubricant with oxygen increases rapidly at higher temperatures. The lubricants undergo a series of chemical reactions that ultimately result in the development of viscous or hard residues that interfere with the operation of the bearing.

Thermal stability, oxidation resistance, and temperature limitations must be considered when selecting greases for high-temperature applications. In non-relubricatable applications, highly refined mineral oils or chemically stable synthetic fluids are required as the oil component of greases for operation at temperatures above 121° C (250° F).

Approximate Temperature Limits For Grease Thickeners		
Soaps	121° C	250° F
Complexes	177° C	350° F
Polyureas	177° C	350° F
Non-soap	>260° C	>500° F

Table 23.

WARNING

Mixing grease types can cause the lubricant to become ineffective, which can result in equipment failure, creating a risk of serious bodily harm.

LUBRICATION AND SEALS - *continued*

WET CONDITIONS

Water and moisture can be particularly conducive to bearing damage. Lubricating greases may provide a measure of protection from this contamination. Certain greases - the calcium, lithium and non-soap type, for example - are highly water-resistant. However, these greases exhibit poor rust preventative characteristics unless properly inhibited.

Sodium-soap greases emulsify with small amounts of moisture that may be present and prevent the moisture from coming in contact with the bearing surfaces. In certain applications, this characteristic may be advantageous; however, emulsions are generally considered undesirable.

Many bearing applications require lubricants with special properties or lubricants formulated specifically for certain environments, such as:

- Friction Oxidation (Fretting Corrosion)
- Chemical and Solvent Resistance
- Food Handling
- Quiet Running
- Space and/or Vacuum
- Electrical Conductivity

For assistance with these or other areas requiring special lubricants, consult your Timken representative.

CONTAMINATION

Abrasive Particles

When roller bearings operate in a clean environment, the primary cause of damage is the eventual fatigue of the surfaces where rolling contact occurs. However, when particle contamination enters the bearing system, it is likely to cause damage such as bruising, which can shorten bearing life.

When dirt from the environment or metallic wear debris from some component in the application is allowed to contaminate the lubricant, wear can become the predominant cause of bearing damage. If, due to particle contamination of the lubricant, bearing wear becomes significant, changes will occur to critical bearing dimensions that could adversely affect machine operation.

Bearings operating in a contaminated lubricant exhibit a higher initial rate of wear than those not running in a contaminated lubricant. But, with no further contaminant ingress, this wear rate quickly diminishes as the contamination particles are reduced in size as they pass through the bearing contact area during normal operation.

Water

Either dissolved or suspended water in lubricating oils can exert a detrimental influence on bearing fatigue life. Water can cause bearing etching that also can reduce bearing fatigue life. The exact mechanism by which water lowers fatigue life is not fully understood. It has been suggested that water enters microcracks in the bearing races that are caused by repeated stress cycles. This leads to corrosion and hydrogen embrittlement in the microcracks, reducing the time required for these cracks to propagate to an unacceptable size spall.

Water-base fluids such as water glycol and invert emulsions also have shown a reduction in bearing fatigue life. Although water from these sources is not the same as contamination, the results support the previous discussion concerning water-contaminated lubricants.

LUBRICATION AND SEALS - *continued*

GREASES

Applications and Lubricating Methods

Grease lubrication is generally applicable to the following conditions, and features low-to-moderate speed applications within operating temperature limits of the grease:

- Easily confined in the housing. This is important in the food, textile and chemical industries.
- Bearing enclosure and seal design simplified.
- Improves the efficiency of external mechanical seals to give better protection to the bearing.
- Successfully used for integrally-sealed, prelubricated ball bearings.

Advantages of Prelubricated Bearings

Prelubricated shielded and sealed bearings are extensively used with much success in applications where:

- Grease might be injurious to other parts of the mechanism.
- Cost and space limitations preclude the use of a grease-filled housing.
- Housings cannot be kept free of dirt and grit, water or other contaminants.
- Relubrication is impossible or hazardous

Prelubricated Timken bearings are prepacked with greases that have chemical and mechanical stability and have demonstrated long life characteristics in rotating bearings. Greases are filtered several times to remove all harmful material and accurately metered so that each bearing receives the proper amount of grease.

GREASE LUBRICATIONS FOR BEARING / HOUSING ASSEMBLIES

Polyurea and lithium-based greases are normally preferred for general purpose bearing lubrication and are advantageous in high moisture applications. Both greases have good water-resistant characteristics. For temperature ranges of standard greases, see chart on page 61.

The grease must be carefully selected with regard to its consistency at operating temperature. It should not exhibit thickening, separation of oil, acid formation or hardening to any marked degree. It should be smooth, non-fibrous and entirely free from chemically active ingredients. Its melting point should be considerably higher than the operating temperature.

Frictional torque is influenced by the quantity and the quality of lubricant present. Excessive quantities of grease cause churning. This results in excessive temperatures, separation of the grease components, and breakdown in lubrication values. In normal speed applications, the housings should be kept approximately one-third to one-half full.

Only on low-speed applications may the housing be entirely filled with grease. This method of lubrication is a safeguard against the entry of foreign matter, where sealing provisions are inadequate for exclusion of contaminants or moisture.

During periods of non-operation, it is often wise to completely fill the housings with grease to protect the bearing surfaces. Prior to subsequent operation, the excess grease should be removed and the proper level restored.

Applications utilizing grease lubrication should have a grease fitting and a vent at opposite ends of the housing near the top. A drain plug should be located near the bottom of the housing to allow purging of the old grease from the bearing.

Relubricate at regular intervals to prevent damage to the bearing. Relubrication intervals are difficult to determine. If plant practice or experience with other applications is not available, consult your lubricant supplier.

LUBRICATION AND SEALS - *continued*

MULTI-PURPOSE INDUSTRIAL GREASE

These are typical of greases that can be used to lubricate many Timken bearing applications in all types of standard equipment. Special consideration should be given to applications where speed, load, temperature or environmental conditions are extreme.

Suggested Lithium Soap, Lithium Complex, and Calcium Sulfonate Grease Properties

Thickener type	Lithium Complex, or equivalent
Consistency	NLGI No.1 or No. 2
Additives	Anti-wear, corrosion and oxidation inhibitors
Base oil	Mineral oil or synthetic
Viscosity at 40° C	ISO VG 150-220
Viscosity index	80 min.
Pour point	-18° C max.

Lithium greases, Lithium Complex Greases, or Calcium Sulfonate thickened grease are suitable for most centralized, Single Point, or manual lubricated product. They should be a smooth, homogeneous and uniform, premium-quality product composed of mineral or synthetic oil, a thickener, and appropriate inhibitors. It should not contain materials that are corrosive or abrasive to roller bearings. The grease should have excellent mechanical and chemical stability. The grease should contain inhibitors to provide long-term protection against oxidation in high-performance applications and protect the bearings from corrosion in the presence of moisture.

The suggested base oil viscosity covers a fairly wide range. Lower viscosity products should be used in high-speed and/or lightly loaded applications to minimize heat generation and torque. Higher viscosity products should be used in moderate- to low-speed applications and under heavy loads to maximize lubricant film thickness. Speed ratings are listed for each size/class part number in the Spherical Roller Bearing section (pages 80 to 96) of the catalog. When speeds of application exceed 70% of grease speed rating, consider increasing RIC by one ISO clearance range (C_{Normal} to C3).

Never mix greases (type or manufacturer). Incompatibility can inhibit proper lubrication. Table 23 on page 62 is provided as a reference for typical grease thickener compatibilities. Consult your lubricant supplier for further information for your specific requirement. For general industrial applications consider a grease that is NLGI No. 1 or No. 2, with a ISO 150 to 220 viscosity grade.

Application Considerations

For higher speed applications (operating at 75 percent of the grease speed rating or more), a grease with a lighter base oil viscosity (ISO100-150) can be considered. Conversely, for lower speed applications, a grease with a heavier base oil viscosity (ISO 320-460) can be considered.

For lower speed applications operating at colder start up temperatures (<0 °F), consider a softer grease (NLGI grade 1) with an approved EP additive. The lighter grade will allow more grease flow into the bearing contact area and the EP additive will reduce wear during startup. An ISO 460 base oil viscosity can also be considered.

When lower speed applications operate at higher temperatures (>300 °F), consult a local Timken sales representative.

Grease Fill

For normal industrial applications, fill the bearing void to 70 to 100 percent full and the housing void to 50 percent full. For high speed applications, fill the bearing void to 30 to 70 percent full and the housing void to 33 percent full. The free volume of the bearing can be estimated by first calculating the "solid ring" volume of the bearing. Then, weigh the bearing and divide the weight by the density of steel. This "actual" volume can then be subtracted from the "solid ring" volume. The resultant value is an estimate of the free volume of the bearing available for grease fill. When the grease volume is determined for the application, multiplying this value by the density of the grease will yield the approximate weight of the grease fill. After weighing the grease required, apply approximately 75 percent of the amount into the cage and roller assembly. The remaining amount of grease should then be applied to both inner and outer rings in equal amounts.

The preservatives applied to bearing components are compatible with nearly all industrial greases: and should not be wiped or cleaned prior to packing the bearing. If in doubt, contact a local Timken sales representative.

Re-Greasing Cycle

The two primary considerations that determine the re-greasing cycle on any application are operating temperature and sealing efficiency. Obviously, seal leakage will dictate frequent relubrication. Every attempt should be made to maintain seals at peak efficiency. Generally the higher the temperature, the more rapidly the grease oxidizes. Grease life is reduced by approximately half for every 10° C (50° F) rise in temperature. The higher the operating temperature, the more often the grease must be replenished. In most cases, experience in the specific application will dictate the frequency of lubrication.

LUBRICATION AND SEALS - *continued*

Timken application specific lubricants have been developed by leveraging our knowledge of tribology and anti-friction bearings and how these two elements affect overall system performance. Timken lubricants help bearings and related components operate effectively in demanding industrial operations. High-temperature,

anti-wear and water-resistant additives offer superior protection in challenging environments. This chart is intended to provide an overview of the Timken greases available for general applications. Contact your local Timken representative for a more detailed publication on Timken lubrication solutions.

LUBRICATION SELECTION GUIDE

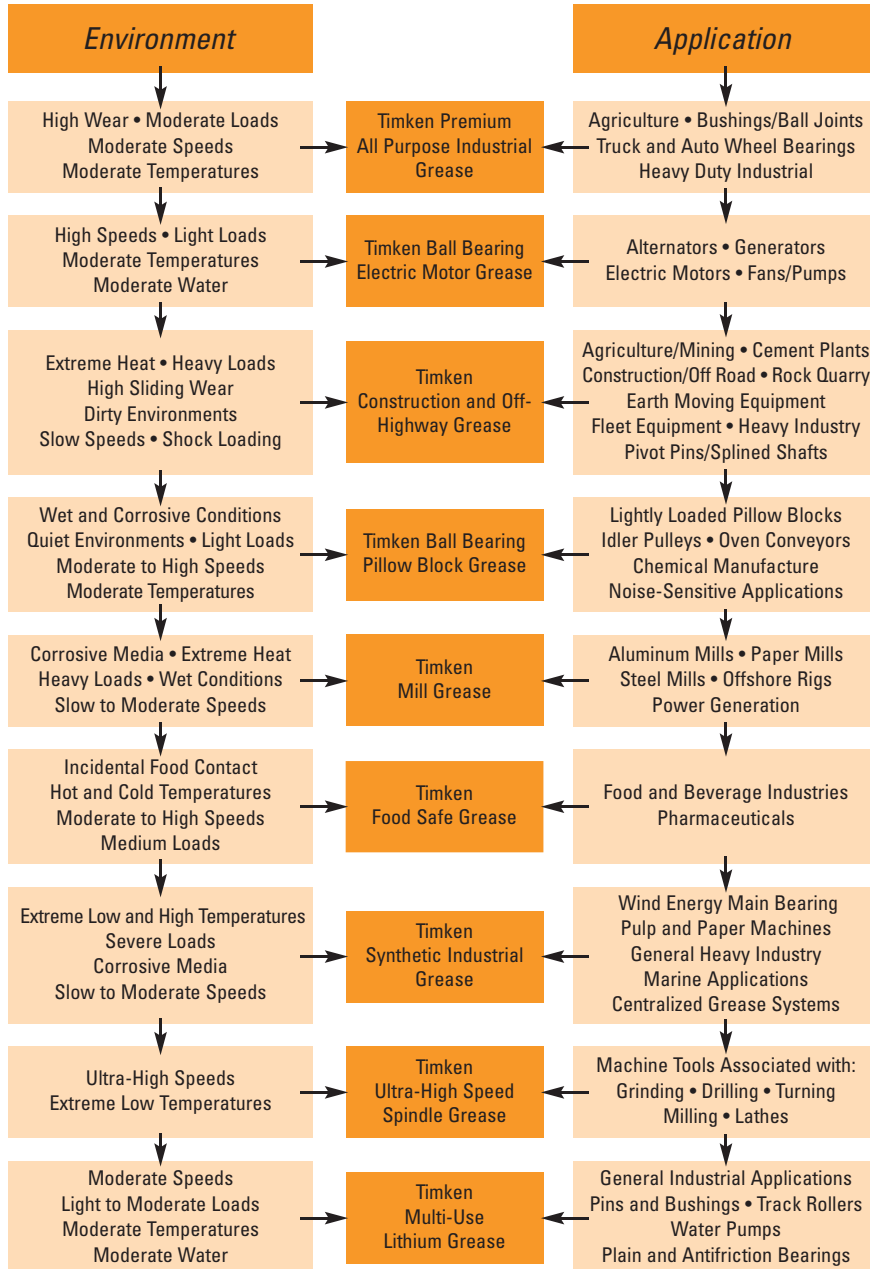

Table 24.

This selection guide is not intended to replace specific suggestions by the equipment builder.

LUBRICATION AND SEALS - *continued*

SELECTING THE RIGHT SEAL

When selecting the proper seal design for any Timken bearing application, it is necessary to consider the type of lubricant, the operation environment, the speed of the application and general operating conditions.

Grease Lubrication - Venting

In any bearing application, good design practice allows for adequate venting in case of heat generation. This is especially valid when grease lubrication is used in conjunction with contact or non-contact seals. This will also help prevent an ingress of contamination past the seals in the event that a pressure differential is created between the bearing cavity and the ambient environment.

Precision triple-ring labyrinth seals are supplied with all Timken pillow blocks to exclude foreign matter and retain lubricants. The pillow block base includes extra large oil return holes at the bottom of the seal grooves to prevent leakage past the seals. For additional information on seal options not shown, contact your Timken representative.

TACONITE SEALS

FTV Series

Flinger Taconite Seal with V-ring

- Combines the qualities of the face labyrinth seal and the DUSTAC seal to improve the sealing efficiency for extremely contaminated environments.
- The rotating flinger added to the basic design, incorporates face labyrinth grooves and compresses the O-ring in the bore. This protects against incursion of foreign matters and ensures regular pressure of the V-ring to the cartridge face.

FTL Series

Flinger Taconite Seal with Lip Seal

- The FTL seal has the same property as the FTV Series, but above the V-ring is substituted to a lip seal working directly on the Flinger Lip to prevent the shaft of any grooving.
- The FTV and FTL Taconite seals can be substituted in either ER or LER ring SAF pillow block series and do not require modifications to the standard housings.

NOTE: *Flinger Taconite seals can be substituted to "ER" or "LER" seal. Add the suffix "L" to the number when it is for a housing using LER Seals (e.g., FTV-515L for SAF-515L pillow block).*

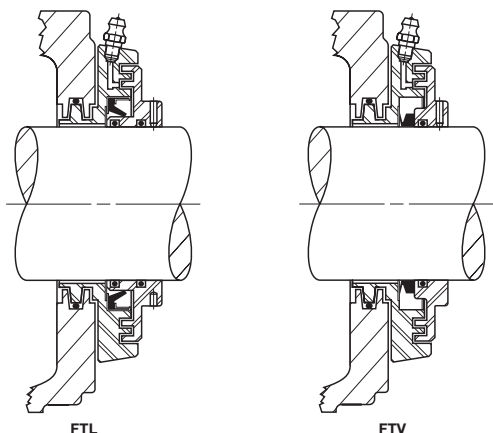

Fig. 24. Taconite seal designs.

Shaft Finish

It is important to ensure that no spiral grooves result from machining shaft surfaces since these will tend to draw lubricant out of, or contaminant into, the bearing cavity. Plunge grinding normally produces a satisfactory surface finish.

Vertical Shaft Closures - Oil Lubrication

Lubricating vertical shaft bearings is a difficult problem. Normally, grease, oil mist or oil-air lubrication is used because of the simplicity. However, some high speed and/or heavy load applications will use circulating oil. This requires a very good sealing system and a suction pump to remove the oil from the bottom bearing position.

LABRINYTH SEALS

- Using labyrinth seals greatly increases the operating time between maintenance intervals of rotating equipment.
- Used in split pillow blocks.
- Endures extreme environments such as pulp and paper, chemical and mining because of its exceptional design.
- Two-piece labyrinth seal of Teflon® PTFE fluoropolymer resin. The assembly inhibits the passage of contaminants or lubricants and prevents the components from coming apart during installation and service.
- Installation is simple compared to many other lip-contact type seals and is more effective in reducing lubricant loss, improving plant safety. It is also environmentally friendly.

Other Benefits Include:

- Drop-in style eliminates machining or modification to housing.
- Interchangeable with LER or taconite seals.
- Available for standard Inch and SNH pillow blocks (1³/₄ in. to 8 in. shaft diameter).
- Minimizes lubricant leakage.
- Accommodates greater shaft misalignment or eccentricity.
- Reduced number of components over conventional seals.

Fig. 25. Labrinyth seal designs.

SPEED, HEAT AND TORQUE

SPEED RATINGS

There is no precise method for determining the maximum speed at which a bearing may operate. Bearing characteristics and features of surrounding parts, shafts, housing and other components as well as basic service conditions, are all variables dependent upon each other for continued satisfactory high-speed performance.

The safe operating speed of a bearing is often limited by the temperature within the bearing, which in turn is often dependent upon the temperature surrounding the application, accuracy of the bearings, shafts, housings, auxiliary parts and the type and amount of lubricant. Bearings with proper internal refinements will operate at high speeds for long periods if properly installed and lubricated. Tolerance grade, cage design, and lubricant are bearings characteristics that affect speed limitations.

Although the speed rating values tabulated within are based on many years of research and accumulated data, numerous applications of Timken bearings are successfully operating with speed values in excess of those tabulated. Such applications require particular consideration of proper tolerance grade, lubrication, the effect of centrifugal force on rolling elements and other factors. For further information consult your Timken representative.

Conversely, under certain application conditions of load, temperature, contamination, etc., speed capabilities may be less than published within.

For spherical roller bearings, the thermal speed ratings are listed in the bearing tables. These values have been determined by balancing the heat generated within the bearing with the heat dissipated from the bearing. In calculating these numbers, the following assumptions have been made:

- The radial load is 5 percent of the static load rating.
- For oil, it is assumed to be in a bath with the fill to the middle of the lowest rolling element. For grease it is assumed a 30 percent bearing cavity fill.
- The oil viscosity is assumed to be 12 cSt (ISO VG 32) operated at 70° C (158° F) and the grease base oil viscosity is assumed to be 22 cSt operated at 70° C (158° F). The bearing and its components are at 70° C (158° F) and the bearing environment is at 20° C (68° F).
- The housing and shaft are steel or cast iron.
- The bearing rotational axis is horizontal.
- The outer ring is stationary and the inner ring is rotating.
- The bearing radial internal clearance complies with class normal and standard fits are used.
- The bearing does not contain seals.
- The bearing does not experience misalignment or axial load.

The speed ratings are for reference only and can be considerably lower or higher depending on your application. Consult your Timken representative for more accurate information regarding a bearing's speed capabilities in your application.

SPEED, HEAT AND TORQUE - *continued*

OPERATING TEMPERATURES

Temperature Limitations

Bearing equilibrium temperature is not simply a question of speed. It is also dependent on the heat generation rate of all contributing heat sources, nature of the heat flow between sources, and heat dissipation rate of the system. Seals, gears, clutches, and oil supply temperature affect bearing operating temperature.

Heat dissipation rate is governed by such factors as type of lubrication system; materials and masses of the shaft and housing and intimacy of contact with the bearing; and surface area and character of the fluid both inside and outside the housing.

Temperature of the outer surface of the housing is not an accurate indication of bearing temperature. The inner ring temperature is often greater than the outer ring temperature and both are usually greater than the outer surface of the housing. There are temperature gradients within the bearing, with the temperature of the internal parts usually being greater than the outer surfaces. Although the temperature of the outer ring O.D., the inner ring I.D., or the oil outlet often used as an indicator of bearing temperature, it should be recognized that these are generally not the highest bearing temperatures.

During transient conditions, such as at startup, bearing temperatures will often peak and then reduce to a lower level. This is due to the thermal changes taking place between the bearing, shaft and housing, causing variations in internal clearance and internal loading. Also, a new bearing will usually generate more heat until it runs in.

The allowable operating temperature depends on:

- Equipment requirements
- Lubrication limitations
- Bearing material limitations
- Reliability requirements

Each factor is an area of increasing concern as operating temperatures rise.

The equipment designer must decide how operating temperature will affect the performance of the equipment being designed. Precision machine tools, for example, can be very sensitive to thermal expansions. In many cases it is important that the temperature rise over ambient be minimized and held to 20 to 25° C (36 to 45° F) for some precision spindles.

Most industrial equipment can operate satisfactorily with considerably higher temperature rises. Thermal ratings on gear drives, for example, are based on 93° C (200° F).

Some equipment such as plastic calendars and gas turbine engines operate continuously at temperatures well above 100° C (212° F).

Standard bearing steels cannot maintain the desired minimum hot hardness of 58 Rc much above 135° C (275° F).

Standard Timken spherical roller bearings are dimensionally stabilized up to 200° C (392° F). Upon request, the bearings can be ordered with dimensional stabilization up to 250° C (482° F) or 300° C (572° F).

Consult your Timken representative for availability of S1, S2, S3 suffixes or high-temperature steels in specific part numbers and applications.

Although bearings can operate satisfactorily at higher temperatures, an upper temperature limit of 80 to 95° C (176 to 203° F) is usually more practical for small, high volume equipment where prototype testing is possible. Higher operating temperatures increase the risk of damage from some unforeseen, transient condition. If prototype testing is not practical, an upper design limit of 80° C (176° F) is appropriate, unless prior experience on similar equipment suggests otherwise.

History on some machines operating at higher temperatures, such as high-speed rolling mills, offers good background data for establishing limits on new, similar machines.

Obviously none of the above examples of equipment, lubricant or bearing material limitations are single point limitations, but rather areas of gradually increasing concern. It is the responsibility of the equipment designer to weigh all relevant factors and make the final determination of what operating temperature is satisfactory for a particular machine.

Suggested materials for use in rings and rollers at various operating temperatures are listed together with data on chemical composition, hardness and dimensional stability. A temperature of 427° C (800° F) is generally the top limit for successful bearing operation using steels. Above 427° C (800° F), or below where lubricant is not permitted, cast or wrought cobalt alloys are generally used. Although chosen primarily for their good retention of physical properties, they also possess good oxidation resistance at elevated temperatures.

Table 26 provides standard operating temperatures for common bearing component materials. They should be used for reference purposes only as specific alloys used may vary. Other bearing component materials are available on request. Contact your Timken representative for further information.

SPEED, HEAT AND TORQUE - *continued*

These tables provide standard operating temperatures for common bearing component materials. It should be used for reference purposes only as specific alloys used may vary. Other bearing component materials are available on request. Contact your Timken representative for further information.

OPERATING TEMPERATURES FOR BEARING COMPONENT MATERIALS

RINGS AND ROLLERS SINGLE-ROW											
Material	Approximate Chemical Analysis-%	Temp. °F	Hardness Rc	Operating Temperature							
				-73° C -100° F	-54° C -65° F	-17° C 0° F	38° C 100° F	93° C 200° F	121° C 250° F	149° C 300° F	204° C 400° F
Low alloy carbon-chromium bearing steels. 52100 and others per ASTM A295	1C 0.5-1.5Cr 0.35Mn	70	60	STANDARD DIMENSIONAL STABILIZATION <0.0001 in/in dimensional change in 2500 hours at 100° C (212° F). Good oxidation resistance.							
Low alloy carbon-chromium bearing steels. 52100 and others per ASTM A295	1C 0.5-1.5Cr 0.35Mn	70 350 450	58 56 54	Heat stabilized per FS136 <0.0001 in/in dimensional change in 2500 hours at 300° F. When given a stabilizing heat treatment, A295 steel is suitable for many applications in the 177-232° C (350-450° F) range; however, it is not as stable dimensionally as it is at temperatures below 177° C (350° F). If utmost stability is required, use materials in the 316° C (600° F) group below.							
Deep hardening steels for heavy sections per ASTM A485	1C 1-1.8Cr 1-1.5 Mn .06Si	70 450 600	58 55 52	As heat treated and tempered, it is stabilized, <0.0001 in/in dimensional change in 2500 HR at 149° C (300° F).							
Carburizing steels per ASTM A534 (a) low alloy 4118 (b) 8620 (c) high nickel 3310	.2C, .5Cr, .80Mn, .12Mo .2C, .5Cr, .80 Mn, .20 Mo, .55Ni .10C, 1.60Cr, .50Mn, 3.50Ni	70	58	4118, 8620 steel frequently used to achieve extra ductility in inner rings for locking devise bearings. 3310 and others used for extra thick section rings.							
Corrosion Resistant 440C stainless steel per ASTM A756	1C 18Cr	70	58	Excellent corrosion resistance.							
Corrosion Resistant 440C stainless steel per ASTM A756	1C 18Cr	70 450 600	58 55 52	As heat stabilized for maximum hardness at high temperatures (FS238). Good oxidation resistance at higher temperatures. Note load capacity drops off more rapidly at higher temperatures than M50 shown below, which should be considered if loads are high. <0.0001 in/in dimensional change in 1200 hours.							
M-50 Medium High Speed	4 Cr. 4 Mo 1V 0.8C	70 450 600	60 59 57	Recommended where stable high hardness at elevated temperature is required. <0.0001 in/in dimensional change in 1200 hours at 316° C (600° F).							

Table 25.

Dimensional stability data shown above is the permanent metallurgical growth and/or shrinkage only. Thermal expansion effects are not included. Bearings have been made of special material for operation at temperatures above 427° C (800° F). Consult your Timken representative regarding the application.

Note: ASTM A295 bearing steels are suitable for many applications up to 121° C (250° F) but are not as dimensionally stable as they are at temperatures below 100° C (212° F).

SPEED, HEAT AND TORQUE - continued

HEAT GENERATION AND DISSIPATION

One of the major benefits of oil-lubricated systems is that the heat generated by the bearings is carried away by the circulating oil and dissipated through the system.

Heat Generation

Under normal operating conditions, most of the torque and heat generated by the bearing is due to the elastohydrodynamic losses at the roller/race contacts.

The following equation is used to calculate the heat generated by the bearing:

$$Q_{gen} = k_4 n M$$

Where:

- Q_{gen} = generated heat (W or BTU/min)
- M = running torque N-m or lbf-in
- n = rotational speed (RPM)
- k_4 = Dimensional factor to calculate heat generation rate
 = 0.105 for Q_{gen} in W when M in N-m
 = 6.73×10^{-4} for Q_{gen} in BTU/min when M in lbf-in

Heat Dissipation

The heat dissipation rate of a bearing system is affected by many factors. The modes of heat transfer need to be considered. Major heat transfer modes in most systems are conduction through the housing walls, convection at the inside and outside surfaces of the housing, and convection by the circulating lubricant. In many applications, overall heat dissipation can be divided into two categories: heat removed by circulating oil and heat removed through the housing.

Heat Dissipation by Circulating Oil

Heat dissipated by a circulating oil system is:

$$Q_{oil} = k_5 f (\theta_o - \theta_i)$$

If a circulating lubricant other than petroleum oil is used, the heat carried away by that lubricant will be:

$$Q_{oil} = k_6 C_p \rho f (\theta_o - \theta_i)$$

The following factors apply to the heat generation equations listed on this page.

- k_5 Dimensional factor to calculate heat carried away by a petroleum oil
 $k_5 = 28$ for Q_{oil} in W when f in l/min and θ in °C
 $= 0.42$ for Q_{oil} in BTU/min when f in U.S. pt/min and θ in °F
- k_6 Dimensional factor to calculate heat carried away by a circulating fluid
 $k_6 = 1.67 \times 10^{-3}$ for Q_{oil} in W
 $= 1.67 \times 10^{-2}$ for Q_{oil} in BTU/min
- Q_{oil} Oil heat dissipation rate of circulating oil W, BTU/min
- θ_i Oil inlet temperature °C, °F
- θ_o Oil outlet temperature °C, °F
- C_p Specific heat of lubricant J/(kg x °C), BTU/(lb x °F)
- f Lubricant flow rate L/min, U.S. pt/min
- ρ Lubricant density kg/m³, lb/ft³

Other Considerations

Until now, temperature limitation has been discussed in reference to metallurgical considerations. However, installations which operate at high temperatures for extended periods may lose the quality of shaft and housing fits. Carefully machined and heat-treated shafts and housings will minimize trouble from this source. In some applications the internal clearance of bearings may be partially absorbed. For example, during the first few seconds of rotation, a massive housing may keep the outer race cooler than the inner race and rolling elements even if the housing is already at some elevated temperature. Also, during heat soakback when rotation stops, heat may flow back to the bearing along the shaft. If, while stationary, the effects of heat soakback more than remove the radial internal clearance, radial brinell of the races may occur, and the bearing will be rough during subsequent rotation. Bearings with extra internal looseness may be required to compensate for the above conditions.

BEARING TORQUE

The torque equations for spherical roller bearings are given as follows, where the coefficients are based on series and found in Table 27.

$$M = \begin{cases} f_1 \cdot F_g \cdot d + 10^{-7} \cdot f_0 (v \cdot n)^{2/3} \cdot d^3 & \text{if } (v \cdot n) \geq 2000 \\ f_1 \cdot F_g \cdot d_m + 160 \times 10^{-7} \cdot f_0 \cdot d_m^3 & \text{if } (v \cdot n) < 2000 \end{cases}$$

Again, note that the viscosity is in units of centistokes (cSt). The load term (F_g) is as follows:

Radial or Thrust Spherical Roller: $F_g = \max \left(\begin{matrix} 0.8 \cdot F_a \cot \alpha \\ F_r \end{matrix} \right)$

COEFFICIENTS FOR THE TORQUE EQUATION		
Dimension Series	f_0	f_1
39	4.5	0.00017
30	4.5	0.00017
40	6.5	0.00027
31	5.5	0.00027

SPHERICAL ROLLER BEARINGS

Overview: Timken spherical roller bearings feature all of the characteristics that have made Timken renowned – superior design, reliable performance and comprehensive technical support. Spherical roller bearings are designed to manage high radial loads and perform consistently, even when misalignment, marginal lubrication, contamination, extreme speeds and critical application stresses are present.

- **Sizes:** Bore sizes of 25 mm and larger.
- **Markets:** Pulp and paper, power generation, oil field, mining and aggregate processing, wind turbines, gear drives and rolling mills.
- **Features:** Large bores for integration into heavy-duty industrial applications.
- **Benefits:** High load capacity under misalignment conditions from shaft deflections or housing misalignment.

INTRODUCTION

The Timken self-aligning spherical roller bearing is a combination radial and thrust bearing, designed to operate even if shaft and housing are, or become, misaligned under load. This high-capacity bearing is the favored choice when conditions include heavy loads, plus difficulties in establishing or maintaining housing alignment, or when shaft deflection can be expected.

Shaft deflections and housing distortions, caused by shock or heavy loads that lead to misalignment, are compensated with internal self-alignment of the bearing elements during operation. Edge loading of rollers, a condition that limits service life on other types of bearings, does not develop in spherical roller bearings. Optimum bearing capacity can often be realized with up to $\pm 1 \frac{1}{2}$ degrees of misalignment, depending on the size and series of bearing selected.

The spherical roller bearing's inherent compensation for misalignment offers the designer the opportunity to use weldments for housing frames instead of complex castings, eliminating high-cost machining operations. Even when castings may be preferred, bore alignment is less critical if spherical roller bearings are specified. Unit design and construction also make the spherical roller bearing convenient to handle during installation or maintenance.

Several types of radial spherical roller bearings include CJ, YM, YMB, YMD, and VCSJ types.

Bearings are made to ISO Class 0 tolerances. Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.

BEARING TYPES

CJ

YM

- Higher load ratings for longer life.
- Incorporates advanced features and precision-machined, roller-riding, one-piece brass cage.
- Suited for severe conditions of use.

YM

YMB

- Higher load ratings for longer life.
- Incorporates advanced features and precision-machined, land-riding, one-piece brass cage.
- Suited for use in severe conditions.

Tapered Bore with Adapter Sleeve

TAPERED BORE BEARINGS WITH ADAPTER SLEEVES

- SNW adapter assemblies consist of a sleeve and Locknut. Lockwashers are available for shaft mounting of tapered bore "K" bearings.
- Description of shaft mounting techniques for tapered bore bearings with adapter sleeves are found on page 104.

YMD

- Incorporates advanced features and offers higher load ratings for longer life.
- Precision-machined, land-riding and two-pieced brass cages.
- Suited for use in severe conditions.

CJ

- High load ratings for longer life.
- Incorporates stamped steel window type cage for a broad range of applications.
- Utilize advanced features.

VCSJ

- Compact design for general use.
- Stamped steel finger type cage.

SHAKER SCREEN EQUIPMENT

- Vibrating equipment commonly found in the aggregate industry is one of the most demanding applications for spherical roller bearings.
- Timken manufactures spherical roller bearings suited for high rotational speeds, high radial and impact loads, fluctuating and unbalanced loads, misalignment and extreme centrifugal forces in tough environmental conditions.
- The design allows for static and dynamic misalignment in the application while maintaining the bearing's full dynamic capacity. This achieves maximum expected service life.
- Standards and special modification codes are available for shaft (s4 or m6) and housing (P6 or H7) fits as in the engineering section.

TIMKEN SPHERICAL ROLLER BEARING MODIFICATIONS

TKN	SKF	FAG	TIMKEN GENERAL DEFINITION
Other modifications available; contact your local Timken representative for more information.			
CJ	E, CC	J	Spherical with stamped steel cage
YM	M2/CA	M	One-piece roller riding machined brass cage
YMB	MC	MB	One-piece inner ring piloted machined brass cage
C02	C02	T52BE	Inner ring with P5 running accuracy, W4 (SKF does not include W4)
C02 C3	C023	C3, T52BE	Inner ring with P5 running accuracy, C3 RIC
C02 C4	C024	C4, T52BE	Inner ring with P5 running accuracy, C4 RIC
C04	C04	T52BN	Outer ring with P5 running accuracy, W4 (SKF does not include W4)
C04 C3	C043	C3, T52BN	Outer ring with P5 running accuracy, C3 RIC
C04 C4	C044	C4, T52BN	Outer ring with P5 running accuracy, C4 RIC
C08	C08	T52BW C02	P5 running accuracy (C02 and C04)
C08 C3	C083	C3, T52BW	P5 running accuracy (C02 and C04), C3 RIC
C08 C4	C084	C4, T52BW	P5 running accuracy (C02 and C04), C4 RIC
C6	C6	—	Special RIC non-specific
K	K	K	Tapered bore (1: 12 on diameter 22, 23, 30, 31, 32, 33, 39 series)
K	K30	K30	Tapered bore (1: 30 on diameter 40, 41, 42 series)
W4	W4	J26A	Mark high and low points of eccentricity on face of rings
W6R	—	—	Engineered coating on rollers to combat low lube or abrasive contamination
W8	—	—	Rings and rollers TDC [®] coated
W20	W20	SY	Outer ring with standard lubrication holes
W22	W22	700855	Special reduced O.D. tolerance on outer rings
W25	W73	—	Outer ring with counter drilled lubrication hole
W31	W31	—	Bearing inspected to certain quality control requirements
W33	W33	S	Standard lubrication holes and groove in outer ring (FAG drops S from number for sizes larger than 315 mm O.D.)
W33 W4	W503	S + J26A	Timken and FAG drop W33 W4 in conjunction with C08, W507
W33 W22 W31	W512 (W22 + W31 + W33)	S + 700855	Timken and FAG drop W31 in conjunction with C02, C04, and C08
W33 W94	W513 (W26 + W33)	S + H40A	See other component description
W37	—	—	Special finish
W40I	ECB (Prefix)	W209B	Inner ring only made of carburizing grade steel
W40R	—	—	Rollers only made of carburizing grade steel
W45A	W61	—	Tapped lifting holes in face of outer ring to facilitate lifting and handling
W84	W77	H44S (H40)*	Outer ring with standard lubrication holes plugged
W88	—	—	Special reduced bore tolerance on inner ring
W93	—	—	Inner ring with keyway in bore
W94	W26	H40A	Inner ring lubrication holes and retainer face grooves SKF and FAG - no retainer face grooves
W502	W502 (W22 + W33)	S + 700855	W22, W33 and W45A (where feasible)
W507	W507 (W4 + W31 + W33)	S +	W31, W33 and W45A (where feasible)
W509	W509 (W26 + W31 + W33)	S.H40A + ...	W31, W33, W94 and W45A (where feasible)
W525	W525 (W31 + W77)	S.H44S (H40)*	W31, W33, W84 and W45A (where feasible)
W534	W534 (C08 + W507)	—	W507 and C08
W800	VA405	T41A	W22 + W88 + radial internal clearance in upper two-thirds of range specified range (shaker screen modification)
W906A	—	—	C02 + C04 + W31 + W33 + W40I + W40R (offered on tapered bore product, supercedes W507A, W534A)

Table 28.

SPHERICAL ROLLER BEARINGS

SPHERICAL ROLLER BEARINGS

- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.

SPHERICAL ROLLER BEARINGS

SPHERICAL ROLLER BEARINGS - continued

- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.

⁽¹⁾ These factors apply for both inch and metric calculations. See engineering section for instructions on use.

⁽²⁾ Maximum shaft or housing fillet radius that bearing corners will clear.

* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

⁽³⁾ See thermal speed ratings in the engineering section.

⁽⁴⁾ Geometry constant for Lubrication Life Adjustment Factor a₃. See "Bearing Load Ratings and Life Calculations."

SPHERICAL ROLLER BEARINGS

SPHERICAL ROLLER BEARINGS - continued

- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.

⁽¹⁾ These factors apply for both inch and metric calculations. See engineering section for instructions on use.

⁽²⁾ Maximum shaft or housing fillet radius that bearing corners will clear.

* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

⁽³⁾ See thermal speed ratings in the engineering section.

⁽⁴⁾ Geometry constant for Lubrication Life Adjustment Factor a₃. See "Bearing Load Ratings and Life Calculations."

SPHERICAL ROLLER BEARINGS

SPHERICAL ROLLER BEARINGS - continued

- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.

SPHERICAL ROLLER BEARINGS

SPHERICAL ROLLER BEARINGS - continued

- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.

SPHERICAL ROLLER BEARINGS

SPHERICAL ROLLER BEARINGS - continued

- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.

⁽¹⁾ These factors apply for both inch and metric calculations. See engineering section for instructions on use.

⁽²⁾ Maximum shaft or housing fillet radius that bearing corners will clear.

* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

⁽³⁾ See thermal speed ratings in the engineering section.

⁽⁴⁾ Geometry constant for Lubrication Life Adjustment Factor a₃. See "Bearing Load Ratings and Life Calculations."

SPHERICAL ROLLER BEARINGS

SPHERICAL ROLLER BEARINGS - continued

- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.

⁽¹⁾ These factors apply for both inch and metric calculations. See engineering section for instructions on use.

⁽²⁾ Maximum shaft or housing fillet radius that bearing corners will clear.

* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

⁽³⁾ See thermal speed ratings in the engineering section.

⁽⁴⁾ Geometry constant for Lubrication Life Adjustment Factor a₃. See "Bearing Load Ratings and Life Calculations."

SPHERICAL ROLLER BEARINGS

SPHERICAL ROLLER BEARINGS - continued

- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.

⁽¹⁾ These factors apply for both inch and metric calculations. See engineering section for instructions on use.

⁽²⁾ Maximum shaft or housing fillet radius that bearing corners will clear.

* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

⁽³⁾ See thermal speed ratings in the engineering section.

⁽⁴⁾ Geometry constant for Lubrication Life Adjustment Factor a₃. See "Bearing Load Ratings and Life Calculations."

SPHERICAL ROLLER BEARINGS

SPHERICAL ROLLER BEARINGS - continued

- Life calculations, shaft and housing fits, internal clearances, tolerances and other technical data for these bearings are found in the engineering section of this catalog.
- Bearings are available with a tapered bore for adapter type mounting. To order, add the suffix "K" to bearing number (e.g., 23120K).
- Consult your Timken representative for up-to-date information about the availability of the bearings you have selected.

⁽¹⁾ These factors apply for both inch and metric calculations. See engineering section for instructions on use.

⁽²⁾ Maximum shaft or housing fillet radius that bearing corners will clear.

* Available in standard shaker screen bearing design configuration (example: 223xxYMW33W800C4).

⁽³⁾ See thermal speed ratings in the engineering section.

⁽⁴⁾ Geometry constant for Lubrication Life Adjustment Factor a₃. See "Bearing Load Ratings and Life Calculations."

INCH SHAFT ADAPTER ACCESSORIES FOR TAPERED BORE BEARINGS

SNW/SNP – PULL TYPE SLEEVE, LOCKNUT, LOCKWASHER/LOCKPLATE ASSEMBLIES

- The table below shows dimensions for adapter assemblies and components used in the mounting of tapered bore bearings on shafts.
- SNW assembly consists of a sleeve, Locknut and Lockwasher.
- SNP assembly consists of a sleeve, Locknut and Lockplate.

Bearing Number	Accessory Numbers				Shaft Dimensions		Adapter Dimensions Inches			SNW/SNP Assembly Weight lbs.
	Assembly	Sleeve	Locknut	Lockwasher Lockplate	Diameter d in.	Tolerance +0.000 To in.	B ₂ in.	S in.	D ₁ in.

INCH SHAFT ADAPTER ACCESSORIES FOR CYLINDRICAL BORE BEARINGS

LOCKNUT AND LOCKWASHER

- The table below shows dimensions for Locknuts and Lockwashers used in the mounting of cylindrical bore bearings on shafts.
- Other dimensions and tolerances related to shaft configurations also are shown.
- Dimensions are presented according to bearing bore size and are applicable to bearings in the various series (e.g., 222, 223, etc.).

Bearing Bore	Lock-nut	Lock-washer	Thds. Per Inch	Threads						Shaft ⁽²⁾					Locknut		Lockwasher

⁽¹⁾ See page 120 for suggested S-3 shaft tolerances.
⁽²⁾ For W, L, H, S, and M tolerance is -0 to +1/64 in., -0 to +0.4mm.

INCH SHAFT ADAPTER ACCESSORIES FOR CYLINDRICAL BORE BEARINGS

LOCKNUT AND LOCKPLATE

- The table below shows dimensions for Locknuts and Lockwashers used in the mounting of cylindrical bore bearings on shafts.
- Other dimensions and tolerances related to shaft configurations also are shown.
- Dimensions are presented according to bearing bore size and are applicable to bearings in the various series (e.g., 222, 223, etc.).

*Sizes N670 and above: $\frac{3}{8}$

⁽¹⁾ See page 120 for suggested S-3 shaft tolerances.

⁽²⁾ C is outer ring width which may be obtained from bearing dimension tables.

⁽³⁾ For L, H, S, and M tolerance is -0 to +1/64 in, -0 to +0.4mm.

MOUNTING PROCEDURES

Depending on the size of the bearing and the application, there are different methods for mounting roller bearings. In all methods, certain basic rules must be followed.

CLEANLINESS

- Choose a clean environment, free from dust and moisture.
- The installer should make every effort to ensure cleanliness by use of protective screens and clean cloths.

PLAN THE WORK

- Know in advance your plans and have the necessary tools at hand. This reduces the amount of time for the job and decreases the chance for dirt to get into the bearing.

INSPECTION AND PREPARATION

- All component parts of the machine should be on hand and thoroughly cleaned before proceeding.
- Housings should be cleaned, including blowing out the oil holes.
- Do not use air hose on bearings.
- If blind holes are used, insert a magnetic rod to remove metal chips that might be lodged there during fabrication.
- Shaft shoulders and spacer rings contacting the bearing should be square with the shaft axis.
- The shaft fillet must be small enough to clear the radius of the bearing.
- On original installations, all component parts should be checked against the detail specification prints for dimensional accuracy. Shaft and housing should be carefully checked for size and form (roundness, etc.).

SHAFT AND HOUSING FINISH

- Shaft surfaces on which the bearing will be mounted must be clean and free from nicks and burrs.
- For applications with stationary housing and rotating shaft, it is suggested that the bearing seat on the shaft be ground to $1.6\ \mu\text{m}$ (65 $\mu\text{in.}$) Ra maximum.
- If it is impractical to use a ground finish, a machined finish of $3.2\ \mu\text{m}$ (125 $\mu\text{in.}$) Ra is acceptable in many cases, but the amount of interference fit should be slightly increased.
- Housing bores should be finished to $3.2\ \mu\text{m}$ (125 $\mu\text{in.}$) Ra maximum.

Note: Do not remove the bearing from its wrapping until you are ready to mount it.

MOUNTING CYLINDRICAL BORE BEARINGS

Heat Expansion Method

- Most applications require a tight interference fit on the shaft.
- Mounting is simplified by heating the bearing to expand it sufficiently to slide easily onto the shaft.
- Two methods of heating are commonly used:
 - Tank of heated oil.
 - Induction heating.
- The first is accomplished by heating the bearing in a tank of oil that has a high flash point.
- The oil temperature should not be allowed to exceed 121°C (250°F). A temperature of 93°C (200°F) is sufficient for most applications.
- The bearing should be heated for 20 or 30 minutes, or until it is expanded sufficiently to slide onto the shaft easily.
- The induction heating method is used for mounting small bearings in production line assembly.
- Induction heating is rapid. Care must be taken to prevent bearing temperature from exceeding 93°C (200°F).
- Trial runs with the unit and bearing are usually necessary to obtain proper timing.
- Thermal crayons melted at predetermined temperatures can be used to check the bearing temperature.
- While the bearing is hot, it should be positioned squarely against the shoulder.
- Lockwashers and Locknuts or clamping plates are then installed to hold the bearing against the shoulder of the shaft.
- As the bearing cools, the Locknut or clamping plate should be tightened.
- In cases of outer ring rotation, where the outer ring is a tight fit in the housing, the housing member can be expanded by heating.
- The oil bath is shown in Fig. 26. The bearing should not be in direct contact with the heat source.
- The usual arrangement is to have a screen several inches from the bottom of the tank. Small support blocks separate the bearing from the screen.
- It is important to keep the bearing away from any localized high-heat source that may raise its temperature excessively, resulting in race hardness reduction.

Fig. 26. Heat Expansion Method.

- Flame-type burners are commonly used. An automatic device for temperature control is desirable.
- If safety regulations prevent the use of an open heated oil bath, a mixture of 15 percent soluble-oil water may be used. This mixture may be heated to a maximum of 93°C (200°F) without being flammable.

MOUNTING PROCEDURES - *continued*

MOUNTING CYLINDRICAL BORE BEARINGS - *continued*

Arbor Press Method

- The alternate method of mounting, generally used only on smaller sizes, is to press the bearing onto the shaft or into the housing. This can be done by using an arbor press and a mounting tube as shown in Fig. 27.
- The tube can be made from soft steel with an inside diameter slightly larger than the shaft.
- The O.D. of the tube should not exceed the maximum shoulder height given in the table of dimensions.
- The tube should be faced square at both ends. It should be thoroughly clean inside and out and long enough to clear the end of the shaft after the bearing is mounted.

Fig. 27. Arbor press method.

- If the outer ring is being pressed into housing, the O.D. of the mounting tube should be slightly smaller than the housing bore. The I.D. should not be less than the suggested housing backing diameter in the table of dimensions.
- Coat the shaft with a light machine oil to reduce the force needed for a press fit.
- Carefully place the bearing on the shaft, making sure it is square with the shaft axis.
- Apply steady pressure from the arbor ram to drive the bearing firmly against the shoulder.
- Never attempt a press fit on a shaft by applying pressure to the outer ring or a press fit in a housing by applying pressure to the inner ring.

SHAFT MOUNTING TAPERED BORE SPHERICAL ROLLER BEARINGS

- Use a feeler gage with the thinnest blade of .0015 in.
- Place the bearing in an upright position with the inner and outer ring faces parallel.
- Place thumbs on the inner ring bore and oscillate the inner ring two or three elements.
- Position the individual roller assemblies so that a roller is at the top of the inner ring on both sides of the bearing.
- With the roller in the correct position, insert a thin blade of the feeler gage between the roller and the outer ring.
- Move it carefully along the top roller between the roller and outer ring raceway. Repeat this procedure using thicker feeler gage blades until one is found that will not go through.
- The blade thickness that preceded the "no-go" blade is a measure of RIC before installation.
- Start the mounting procedure by lubricating the tapered shaft with a light coat of machine oil.

Fig. 28.

- Slide the bearing onto the shaft as far as it will go by hand.
- As the Locknut is tightened, the interference fit builds up, resulting in expansion of the inner ring.
- Periodically measure to keep track of the reduction in RIC.
- Continue the procedure until the proper amount of reduction is obtained. Do not exceed suggested amount of reduction.
- As a final check, make sure the remaining RIC equals or exceeds the minimum mounted clearance shown in the table to the right.

Table 29.

Note: Axial displacement values apply to solid steel shafts or hollow steel shafts with bore diameter less than half the shaft diameter. For shaft materials other than steel, or for thin-wall shafts, please consult your Timken representative.

** 1:12 Taper used for 222, 223, 230, 231, 232, 233, 239 series. 1:30 Taper used for 240, 241, 242 series. For sleeve mounting, multiply axial displacement values by 1.1 for 1:12 taper or by 1.05 for 1:30 taper. For questions on tapered shaft data, consult your Timken representative.

Fig. 29.

- During mounting, the RIC should be checked at the unloaded roller. If this is at the bottom, make sure that the roller is raised to seat firmly at the inboard position of the inner race.
- When the suggested amount of RIC reduction has been accomplished, the bearing is properly fitted.
- Complete the procedure by peening the Lockwasher tang into the Locknut slot or securing the Lockplate.

NOTES

SPHERICAL ROLLER BEARING PILLOW BLOCKS

Overview: Spherical roller bearing pillow blocks combine rugged cast iron or steel housings with high-capacity bearings to meet the toughest demands of industry. Each pillow block contains an advanced-design spherical roller bearing with improved geometry and raceway finish for maximum load capacity and service life. Integrated housing and bearing features enhance unit lubrication characteristics. Multiple sealing options protect against contamination.

- **Sizes:** 35 - 300 mm shafts (1.37795 - 11.811 in.). Special shaft sizes up to 1000 mm (39.37 in.) and beyond.
- **Markets:** Conveyors, mining, rolling mills, heavy movable structures and pulp, and paper mills.
- **Features:** Split construction for convenient assembly and disassembly. These units include pry tool slots and the exclusive Pry-Lug fulcrum, which simplify bearing inspection, service, and replacement.
- **Benefits:** Caps can be removed easily and quickly without damage to the bearing or housing.

Pillow Blocks

- SAF** two- or four-bolt pillow block, cast iron
- SDAF** four-bolt heavy-duty type pillow block, cast iron
- SAFS** two- or four-bolt pillow block, cast steel
- FSAF** four-bolt pillow block, cast iron (only when an option)
- FSAFS** four-bolt pillow block, cast steel (only when an option)
- SDAFS** four-bolt heavy-duty pillow block, cast steel

To indicate shaft size and used only for pillow block units of 8⁷/₁₆ in. shaft size or larger.

INTRODUCTION

Timken's capabilities in the engineering and manufacture of heavy-duty pillow blocks provide important user benefits. In addition, Timken's worldwide sales organization is staffed with experienced bearing engineers who are available for consultation on any pillow block or bearing application. Expert engineering

assistance is available for applications involving shaft sizes 40 inches and larger such as BOF trunnions, bridge blocks and ball mills. If your design calls for shaft sizes or loads not listed in this catalog, contact your Timken representative for information about availability of special units.

DESIGN AND CONSTRUCTION

Timken supplies pillow blocks equipped with either tapered bore bearings plus adapters for mounting on straight shafts or cylindrical bore bearings for assembly on shouldered shafts.

Timken spherical roller bearing pillow blocks are made of split construction for convenient assembly and disassembly. These units include pry tool slots and the exclusive Pry-Lug fulcrum that simplify bearing inspection, service, and replacement. Caps can be removed easily and quickly without damage to the bearing or housing.

Precision fit is ensured by the Timken system of doweling caps and bases together at an early stage of manufacturing, so that they remain a single unit during machining. They are not interchangeable as separate parts and become precisely mated components.

Timken manufactures pillow blocks in two styles: SAF and SDAF. The larger SDAF block is suggested for extreme duty applications.

Caps and bases are made from high-grade, stress-relieved cast iron as standard. They also are available in cast steel.

All Timken pillow blocks are designed for four-bolt mounting. Certain smaller sizes are normally furnished for two-bolt mounting. These assemblies are indicated in the tables and can be ordered with optional four-bolt base.

Four cap bolts are used in most Timken pillow blocks in order to equalize the pressure between cap and base, preventing loss of lubricant.

The illustration below shows all parts of a pillow block assembly that are described throughout this section.

Fig. 30. Exploded view of a Timken spherical roller bearing pillow block, showing tapered bore spherical roller bearing, adapter sleeve, Locknut and Lockwasher, stabilizing ring and triple labyrinth seals. Recesses in cap and base that form pry tool slot and integral fulcrum lugs in base and cap are shown.

B

MOUNTING

ADAPTER VS. STRAIGHT BORE

Usually a spherical roller bearing pillow block assembly is mounted on a straight shaft using a tapered bore bearing and adapter assembly. Standard commercial shafting can be used without additional machining. (Suggested shaft diameters are shown on page 120.) Adapter mount also permits maximum flexibility in the axial positioning of the bearing on the shaft and will accommodate light locational thrust loads. Timken pillow blocks for tapered bore and adapter mounted bearings are available in Series 225, 226, 230, 231K and 232K.

Adapter mounted spherical roller bearings require the correct removal of diametral clearance from the bearing to prevent relative rotation between inner race and sleeve or shaft. Failure to employ proper mounting procedures can cause heating and reduced bearing performance. For proper shaft mounting of adapter type spherical roller bearings, see page 104 of the spherical roller bearing section.

When application conditions produce heavy thrust loads, or a need exists for exact axial location or a positive shaft interference fit, a direct straight bore mounting may be the best option. This requires a shouldered shaft, machined for proper fit, and a straight bore bearing. Timken pillow block assemblies for straight bore applications are available in Series 222, 223, 231 and 232.

Suggested fits for shafts in cylindrical bore spherical roller bearings are shown in the engineering section. For applications involving heavy shock, vibration, unbalanced rotating loads or other abnormal conditions, consult your Timken representative.

FIXED AND FLOAT PILLOW BLOCKS

Any style of Timken pillow blocks can be easily installed either at the float or fixed position on the shaft. For the fixed position, a stabilizing ring is added between the bearing outer face ring and the housing shoulder to positively locate the shaft and prevent axial movement.

Some applications require centering of the bearing in its housing. To accomplish this, two special width stabilizing rings can be ordered.

In the float position, the ring is not used, allowing the bearing to move axially (a maximum of $\frac{3}{8}$ in.) to compensate for thermal expansion or contraction of the shaft.

Pillow blocks ordered by the numbers in the dimension tables are fixed units. To order float units, specify by adding suffix "Float" or "FL" to the pillow block number.

CLOSED END INSTALLATIONS

In some applications, the shaft end is designed to terminate inside the pillow block. For this design, positive fitting end-closure inserts are available to seal out contaminants and retain lubricant. Timken heavy-duty end plugs include O-rings for positive sealing.

Designers and installers need to make sure the shaft end does not contact the closure. A minimum of $\frac{1}{8}$ in. clearance at maximum thermal expansion is suggested between the end of the shaft and the closure. Dimension "Y" in the tables defines the maximum permissible length of the shaft from the centerline of the pillow block housing. If end closure is desired, specify by adding "CL" (one end closed) to the pillow block assembly number.

LUBRICATION

Timken pillow block housings have been designed for grease and oil bath lubrication. They also can be modified easily to accommodate circulating oil or oil/air mist systems. Grease fittings or sight gages are available upon request.

A lubrication groove and oil holes are provided in the bearing outer ring. This feature, designated by adding suffix "W33" to the bearing number, should be specified whenever re-ordering bearings for pillow blocks. In most cases, the fresh lubricant is fed directly to the center of the bearing between the rows of rollers and distributed to the rest of the bearing. This ensures the used lubricant is purged from the bearing.

SEALS

Precision triple ring labyrinth seals are supplied with all Timken pillow blocks to exclude foreign matter and retain lubricants. The pillow block base includes extra large oil return holes at the bottom of the seal grooves to prevent leakage past the seals.

For extremely contaminated or abrasive environments, Timken has developed the exclusive DUSTAC™ seal. This patented seal offers protection against concentrations of dust or abrasive material that a labyrinth seal cannot keep out. See page 123 for further information on DUSTAC.

LOAD RATINGS AND LIFE

Load ratings for the spherical roller bearings that are used in pillow blocks are found in the dimension tables on pages 80 through 96. Life calculation formulas are found in the engineering section.

In addition to individual bearing selection, the ability of the pillow block to carry the operating load should be considered.

It should be noted that the load rating figures supplied in this catalog are applicable only when the load direction is generally toward the base of the pillow block. If the pillow block must be mounted so the load can be applied in any other direction, consult your Timken representative.

B

**INCH TAPERED BORE MOUNTING
SAF225 AND SAF226 SERIES**

- The basic number for ordering complete pillow block assemblies is listed in the table below.
- Each assembly includes the housing cap and base, cap bolts, bearing, bearing adapter, Locknut and washer, stabilizing ring, and triple ring seals.
- If only the pillow block housing is desired, use the numbers listed in the column headed "Housing Only". These units include: cap, base, cap bolts, triple ring seals and stabilizing ring.
- Assembly and pillow blocks as described on this page constitute a fixed unit. To order float units, specify part number plus suffix "Float" or "FL".

- Assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SAFS 22515).
- Four-bolt bases are standard on all assemblies except as noted.

⁽¹⁾ See page 120 for suggested shaft diameter S-1 tolerances.

⁽²⁾ "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required.

⁽³⁾ Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

⁽⁴⁾ Includes sleeve, Locknut and Lockwasher. Add shaft size to order.

Note: Speed ratings are found in dimension tables in the spherical roller bearing section.

INCH TAPERED BORE MOUNTING SDAF225 AND SDAF226 SERIES

- Each assembly includes the housing cap and base, cap bolts, bearing, bearing adapter, Locknut and washer, stabilizing ring and triple ring seals.
- To order pillow block housing only, use the number listed in the "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals and stabilizing ring.
- Assembly and pillow blocks as described on this page constitute fixed units.
- To order float units, specify part number plus suffix "Float" or "FL".
- Assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SAFS 22515).

⁽¹⁾ See page 120 for suggested shaft diameter S-1 tolerances.

⁽²⁾ "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required.

⁽³⁾ Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

⁽⁴⁾ Includes sleeve, Locknut and Lockwasher. Add shaft size to order.

Note: Speed ratings are found in dimension tables in the spherical roller bearing section.

**INCH TAPERED BORE MOUNTING
SAF230K, SDAF230K SERIES**

- Each assembly includes the housing cap and base, cap bolts, bearing, bearing adapter, Locknut and washer, stabilizing ring and triple ring seals.
- If only the pillow block is desired, use the numbers listed in column "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals and stabilizing ring.
- Assembly and pillow blocks as described on this page constitute fixed units.
- To order float units, specify part number plus suffix "Float" or "FL".
- All assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SAFS 23024).
- Please note that for applications SAF23048 and larger, the shaft size must be included in the part description when ordering (e.g., SAF23048-8¹⁵/₁₆).

Two stabilizing rings are supplied with housings SAF048 through SAF056 and SDAF060K through SDAF076K. For fixed applications **both rings must be used. Do not use stabilizing rings for float mounting.**

INCH TAPERED BORE MOUNTING SDAF231K AND SDAF232K SERIES

- Each assembly includes the housing cap and base, cap bolts, bearing, bearing adapter, Locknut and washer, stabilizing ring and triple ring seals.
- To order pillow block housing only, use the numbers listed in the "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals and stabilizing ring.
- Assembly and pillow blocks described on this page constitute fixed units.
- To order float units, specify part number plus suffix "Float" or "FL".
- All assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SDAFS 23152K).

⁽¹⁾ See page 120 for suggested shaft diameter S-1 tolerances.

⁽²⁾ "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required. Add shaft size to order.

⁽³⁾ Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

⁽⁴⁾ Includes sleeve, Locknut and Lockwasher. Add shaft size to order.

Note: Speed ratings are found in dimension tables in the spherical roller bearing section.

**INCH STRAIGHT BORE MOUNTING
SAF222 AND SAF223 SERIES**

- Each assembly includes the housing cap and base, cap bolts, bearing, Locknut and washer, stabilizing ring and triple ring seals.
- To order pillow block housing only, use the numbers listed in "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals and stabilizing ring.
- Assembly and pillow blocks described on this page constitute fixed units.
- To order float units, specify part number plus suffix "Float" or "FL".
- All assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SAFS 22217).
- Four-bolt bases are standard on all assemblies, except as noted.

(1) See page 120 for suggested shaft diameter S-2, S-3 tolerances.

(2) "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required.

(3) Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

Note: Speed ratings are found in dimension tables in the spherical roller bearing section.

INCH STRAIGHT BORE MOUNTING SDAF222 AND SDAF223 SERIES

- Each assembly includes the housing cap and base, cap bolts, bearing, Locknut and washer, stabilizing ring, and triple ring seals.
- To order pillow block housing only, use the numbers listed in the "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals and stabilizing ring.
- Assembly and pillow blocks described on this page constitute fixed units.
- To order float units, specify part number plus suffix "Float" or "FL".
- All assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SDA_S 22220).

⁽¹⁾ See page 120 for suggested shaft diameter S-2, S-3 tolerances.

⁽²⁾ "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required.

⁽³⁾ Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

Note: Speed ratings are found in dimension tables in the spherical roller bearing section.

INCH STRAIGHT BORE MOUNTING SDAF231 AND SDAF232 SERIES

- Each assembly includes the housing cap and base, cap bolts, bearing, Locknut and washer, stabilizing ring and triple ring seals.
- To order pillow block housing only, use the numbers listed in the "Housing Only" column. These units include: cap, base, cap bolts, triple ring seals, and stabilizing ring.
- Assembly and pillow blocks described on this page constitute fixed units.
- To order float units, specify part number plus suffix "Float" or "FL".
- All assemblies shown are furnished in cast iron. If cast steel is desired, add the letter "S" to the alpha prefix (e.g., SDAFS 23152).
- For fixed applications, both stabilizing rings must be used. Do not use stabilizing rings for "Float" mounting.

⁽¹⁾ See page 120 for suggested shaft diameter S-2, S-3 tolerances.

⁽²⁾ "Housing Only" includes: cap, base, cap bolts, triple ring seals and stabilizing rings as required.

⁽³⁾ Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

Note: Speed ratings are found in dimension tables in the spherical roller bearing section.

Triple lip seals for other shaft diameters are available upon special order.

INCH TU TAKE-UP UNITS

- The same care taken in the selection of stationary pillow blocks must also be applied to selecting the proper take-up unit.
- Load requirements should be carefully evaluated before specifying a particular Timken take-up assembly.
- The pedestal is made of stress-relieved cast iron. End bases are made of ductile iron. The guide rail and screw are steel.
- Units are available with travel lengths from 12 to 36 inches, in 6-inch increments.
- Catalog numbers shown here are for the TU take-up unit only; pillow block assemblies must be ordered separately.
- Both two- and four-bolt pedestals are available and must be specified.

TU Take-Up Unit Catalog Number	Pillow Block Housing Number (SAF or SDAF)		A	C	E	F Bolt Size	G	H	K

* Enter 12, 18, 24, 30 or 36 to indicate travel in inches.

INCH TTU TAKE-UP UNITS

- The same care taken in the selection of stationary pillow blocks must also be applied to selecting the proper take-up unit.
- Load requirements should be carefully evaluated before specifying a particular take-up assembly.
- Frame assembly and adjusting screw of TTU units are made of steel.
- The bearing housing is cast iron. Steel or ductile iron housings are additional options.
- Units include housing for adapter-mounted bearings only, for either fixed or float position (be sure to specify).
- One stabilizing ring is included for fixed position assemblies.
- Sealing is triple ring labyrinth or end closures.
- For extremely contaminated environments, the DUSTAC seal is suggested. (See the next page for more information on DUSTAC.)

⁽¹⁾ See page 120 for suggested shaft diameter S-1 tolerances.

Note: Speed ratings are found in dimension tables in the spherical roller bearing section.

⁽²⁾ Stabilizing ring is used for fixed (FX) block; do not use for float (FL) mounting.

⁽³⁾ Includes sleeve, Locknut and Lockwasher. Add shaft size to order.

INCH DUSTAC™ SHAFT SEAL

- Suggested for pillow blocks used in extremely contaminated environments, such as taconite mines.
- Provides protection against residual and airborne contaminants that exceeds the triple labyrinth shaft seal.
- Contributes significantly to extending bearing life; reduces costs by helping prevent premature bearing damage.
- Because of its unique design, no special finish is required on the shaft. DUSTAC is a patented device utilizing a V-shaped nitrile ring that rotates with the shaft and applies pressure to the cartridge face to exclude contaminants.

Table 30.

ORDER INSTRUCTIONS

- Shaft seal may be ordered in place of the standard LER triple ring seals supplied with the pillow blocks listed. They also are available to retrofit existing installations.
- To order any pillow block housings with DUSTAC shaft seal on both sides, add the suffix “DV” to the number (e.g., SAF2522DV).
- To order pillow block housings with DUSTAC shaft seal and one end closed, add the suffix “DC” to the number (e.g., SAF22522DC).
- Standard sizes of DUSTAC shaft seals are shown in the table. Other sizes are available upon request.

INSTALLATION PROCEDURE

1. Check shaft diameters to print specification. Remove any burrs or sharp edges. Be sure shaft surface is clean and dry beyond the area of seal location.
2. Expand the V-ring seal over the shaft to the approximate inboard position (reference dimension “B” in the tables). *Make sure the lip of the seal faces the bearing.*
3. Slide the seal cartridge onto the shaft until the V-ring fits into its cavity.
4. Mount the bearing, sleeve, Lockwasher and Locknut in normal manner and adjust for internal clearance.
5. If both ends have seals, repeat steps 2 and 3 with the V-ring going on last with its lip facing the bearing.
6. Thoroughly clean the housing base and remove any paint or burrs from the mating surfaces of the housing cap.
7. Lower shaft, bearing and seals into the housing base, taking care to guide the seals into the seal grooves.

8. On each shaft there must be only one fixed bearing. If the bearing is to be fixed, the stabilizing ring can be inserted between the bearing outer ring and the housing shoulder on the Locknut side of the bearing. All other bearings on this shaft should be centered in the housing.
9. The upper half of the housing or cap should be thoroughly cleaned and checked for burrs. Place it over the bearing and seals. The dowel pins will align the cap to the base. NOTE: housing caps and bases are not interchangeable.
10. After cap bolts are tightened, it is most important to position the V-ring seal to its proper fitted width. This is accomplished by moving the seal until it is flush with the outside face of the cavity. This provides proper compression of the lip against the cartridge face.

Fig. 31. DUSTAC™ design features.

INCH SINE BAR GAGES

- Tapered-bore, anti-friction bearings are mounted either on adapter sleeves or on tapered shaft seats.
- In cases where tapered bore bearings are mounted directly on the shaft, the shaft must conform to the tapered bore of the bearing to assure proper fit. If a proper fit is not achieved, the results could be:
 1. Turning of the bearing inner race on the shaft.
 2. Uneven loading of the bearing.
 3. Severe inner race hoop stress.
 4. Insufficient support (back-up) of the inner race on the shaft.
- All of these conditions could lead to premature bearing damage. Therefore, the manufacture, maintenance and measurement of accurate shaft tapers is important.
- There are two accepted ways of measuring tapered shafts: ring gages and sine bar gages.
- Precision measurement of tapered shafts is difficult with ring gages and may be impossible in the case of large shafts where gages are large, cumbersome and heavy.
- Sine bar gages provide an accurate and easy method of measurement.
- Lightweight and easy to handle and learn, sine bar gages achieve precise gaging of the shaft size and taper.

Fig. 32. Parts of a sine gage.

- A complete set for measurement of 1:12 shaft tapers consists of 3 in., 4 in., 5 1/2 in., 7 in., 10 in. and 14 in. sine bar gages, sine bar saddle no. T-5491-C, web clamp no. T-5489-A and a wooden box no. T-5224-C. A complete set for 1:30 shaft tapers consists of 4 in., 6 in., 8 in. and 12 in. sine bar gages.
- Sine bars can be purchased individually, or in any combination of sizes to meet your individual needs.
- All sine bars require a sine bar saddle and web clamp. A wooden box is optional.
- For information on the use of sine bars, prices and delivery, consult your Timken representative.

Table 32.

The table above represents the sine bar sizes developed for a full range of tapered bore bearings with 1:12 and a 1:30 taper. Additional sizes are available to fit a variety of width and taper combinations. Consult your local Timken representative for availability.

INCH HYDRAULIC NUTS

INTRODUCTION

- Designed to install and remove tapered bore bearings with minimal effort.
- Allow better control of the bearing internal clearance reduction without damaging the bearing or other components.
- Substantially reduces downtime during installation or removal of tapered bore bearings.

DESCRIPTION

- Consist of a female threaded ring and a male ring with two O-ring seals.
- All hydraulic nuts are supplied with:
 - Quick connection fittings (male ¼ in. B.S.P. and female ⅜ in. N.P.T.).
 - Two pipe plugs ¼ in. B.S.P.
 - One set of spare O-rings.

INSTRUCTIONS

- When the hydraulic nut is used, the piston must be in the innermost position.
- For this operation, please ensure the valve of the hydraulic hose is disconnected from the nut so the nut is not under pressure.
- To contract the piston inside the female threaded ring, insert a rod or bar in one of the four drilled holes located on the outside diameter of the female threaded ring.
- Screw the hydraulic nut on the thread with the piston in contact with the surface, until the groove machined on the outside diameter of the piston near the outboard face is level with the face of the female threaded ring.
- One of the two threaded holes must be plugged with the ¼" B.S.P. pipe plug before the hydraulic nut is pressurized.
- The maximum pressure permissible in the hydraulic nut is 14000 psi (110 Kpa).
- The oil viscosity suggested is 1400 SUS (300cSt) at operating temperature (SAE 90 oil).
- To avoid overextension of the piston, a second groove has been machined on the outside diameter of the piston inboard used to judge contraction.
- When this second groove is level with the face of the female threaded ring, the piston has reached its length of travel as shown in the illustration. If the second groove of the piston travels past the face of the female threaded ring, the hydraulic nut can be damaged.
- Should the oil start to leak from the piston area, it is certain that the O-ring seals are damaged or worn and need to be replaced.
- When the hydraulic nut is not in use, ensure that the threaded holes are plugged to prevent entry of contaminants in the piston cavity.
- To help prevent against corrosion during storage, apply a coat of light oil on the hydraulic nut surfaces.
- Contact your Timken representative to receive special warnings against reasonably unforeseen dangers.

ORDERING COMPONENTS:

- To order spare components for the hydraulic nuts, order part numbers as listed below:
 - O-ring Seal Kits:
Use the hydraulic nut part number plus the number 132.
Example: HMVC 40/132
 - Pipe Plug ¼ in. B.S.P.:
Use the hydraulic nut part number plus the number 647.
Example: HMVC 40/647
 - Quick Connection Fittings (male ¼ in. B.S.P. and female ⅜ in. N.P.T.):
Use the hydraulic nut part number plus the number 849.
Example: HMVC 40/849

ENGINEERING SERVICES

- Special applications should be referred to a Timken representative for review.

INSTALLATION

Hydraulic nut used to mount the bearing on a pull type sleeve.

Hydraulic nut used to mount the bearing on tapered journal.

Hydraulic nut used to mount the bearing on a push type adapter sleeve.

REMOVAL

Hydraulic nut used to withdraw a push type adapter sleeve.

HMVC - 10 through HMVC - 64 have American National Threads Class 3.
 HMVC - 68 through HMVC-190 have Acme General Purpose Threads Class 3G.

INCH SHAFT ADAPTER ACCESSORIES FOR TAPERED BORE BEARINGS

SNW/SNP - PULL TYPE SLEEVE, LOCKNUT, LOCKWASHER/LOCKPLATE ASSEMBLIES

- The table below shows dimensions for adapter assemblies and components used in the mounting of tapered bore bearings on shafts.
- SNW assembly consists of a sleeve, Locknut and Lockwasher.
- SNP assembly consists of a sleeve, Locknut and Lockplate.

Tapered bore bearing plus SNW.

Bearing Number	Accessory Numbers				Shaft Dimensions		Adapter Dimensions			SNW/SNP Assembly Weight
	Assembly	Sleeve	Locknut	Lockwasher Lockplate	d Diameter	Tolerance +0.000" To	B ₂	S	D ₁

INCH SHAFT ADAPTER ACCESSORIES FOR TAPERED BORE BEARINGS

SNW/SNP - PULL TYPE SLEEVE, LOCKNUT, LOCKWASHER/LOCKPLATE ASSEMBLIES

- The table below shows dimensions for adapter assemblies and components used in the mounting of tapered bore bearings on shafts.
- SNW assembly consists of a sleeve, Locknut and Lockwasher.
- SNP assembly consists of a sleeve, Locknut and Lockplate.

Tapered bore bearing plus SNW.

Bearing Number	Accessory Numbers				Shaft Dimensions		Adapter Dimensions			SNW/SNP Assembly Weight
	Assembly	Sleeve	Locknut	Lockwasher Lockplate	d Diameter	Tolerance +.000" To	B ₂	S	D ₁	
					in.	in.	in.	in.	in.	lbs.

INCH SHAFT ADAPTER ACCESSORIES FOR STRAIGHT BORE BEARINGS

LOCKNUT AND LOCKWASHER

- The chart below shows dimensions for Locknuts and Lockwashers used in the mounting of straight bore bearings on shafts.
- Other dimensions and tolerances related to shaft configurations are also shown.
- Dimensions are presented according to bearing bore size and are applicable to bearings in the various series (e.g., 222 and 223 etc.).

Bearing Bore	Locknut	Lockwasher	Threads Per Inch	Threads					
				Major Diameter		Pitch Diameter		Minor Dia.	A Relief Dia.
				Min.	Max.	Min.	Max.		
mm				mm in	mm in	mm in	mm in	mm in	mm in

⁽¹⁾ See page 120 for suggested S-3 shaft limits.
⁽²⁾ For W, L, H, S, and M tolerance is -0 to +1/64 in, -0 to +0.4mm.

INCH SHAFT ADAPTER ACCESSORIES FOR STRAIGHT BORE BEARINGS

LOCKNUT AND LOCKPLATE

- The chart below shows dimensions for Locknuts and Lockplates used in the mounting of straight bore bearings on shafts.
- Other dimensions and tolerances related to shaft configurations are also shown.
- Dimensions are presented according to bearing bore size and are applicable to bearings in the various series (e.g., 222,223 etc.).

Bearing Bore	Locknut	Lockplate	Threads Per Inch	Threads					
				Major Diameter		Pitch Diameter		Minor Dia.	A Relief Dia.

SPHERICAL ROLLER BEARING METRIC ACCESSORIES

SPHERICAL ROLLER BEARING METRIC ACCESSORIES

Overview: Spherical roller bearing accessories are manufactured to the same quality standards as our bearings, ensuring a secure fit to straight and stepped shafts.

- **Sizes:** Accessories are available for shaft sizes 25 mm to >900 mm.
- **Markets:** Conveyors, mining, pulp and paper, rolling mills, heavy movable structures.
- **Features:** Extensive product range, including hydraulic assist, for integration into a full range of industrial applications.
- **Benefits:** Supports full range of installation and removal needs, minimizing the chance for damage to the bearing.

C

Accessories for your every need. To complement our line of Timken® spherical roller bearings, we offer bearing sleeves and locking devices in a wide range of metric sizes. These accessories are manufactured to the same quality standards as our bearings, ensuring a secure fit to straight and stepped shafts. Available in sizes up to 900mm, bearing sleeves are available in two distinct designs: assembled adapter sleeves and withdrawal sleeves.

ADAPTER SLEEVES

Timken adapter sleeves are used in conjunction with a nut and locking device to mount a tapered bore bearing onto a straight shaft using a pull-type fit. Smaller size assemblies (17 mm - 200 mm shaft) commonly use simple nuts, whereas larger assemblies (sizes >200 mm) may use HMV hydraulic nuts to assist in mounting. The chart below outlines our part number nomenclature, which is consistent with the world standards for adapter sleeves.

Sleeve	Locknut	Locking Device
H standard metric	KM	MB
OH hydraulic assist	HM	MB
	KML	MBL

WITHDRAWAL SLEEVES

Withdrawal sleeves feature a push-type mounting arrangement and a locking device (i.e., Locknut or Lockplate) to secure a bearing to a shaft. This design is not as widely used as the adapter sleeve assembly and it does require the use of a specially designed dismounting nut. Timken's part number nomenclature for withdrawal sleeves also conforms to industry-accepted standards.

Sleeve	Dismounting Nuts	Hydraulic Nut
AH standard metric	KM, HM	HMV
AOH hydraulic assist

(1) Adapter sleeves are supplied complete with Locknuts and Lockwasher or Lockplates.
 (2) Adapters with bores for English standard shafts are designated HE, (e.g. HE3024).
 (3) Adapters with bores for American standard shafts are designated HA, (e.g. HA3024).
 (4) Adapters with the dimension C₁ have a locking device as shown in the illustration.

(1) Dimension L₁ decreases as the withdrawal sleeve is driven in during mounting.

(2) Tr means 30°. Trapezoid thread and the digits are outside diameter of thread and pitch.

(1) Dimension L₁ decreases as the hydraulic withdrawal sleeve is driven in during mounting.
 (2) Tr means 30°. Trapezoid thread and the digits are outside diameter of thread and pitch.

NOTES

The Product index below lists all the Timken bearings and accessories contained in this Catalog by item number, page, product description, and section. Asterisk (***) shown indicate that additional numbers / letters are necessary to complete the part numbers. Spherical roller bearings are shown by series designations not individual part numbers. (i.e. 2223BR would be found under 222** series).

ITEM	PAGE	PRODUCT DESCRIPTION	SECTION	ITEM	PAGE	PRODUCT DESCRIPTION	SECTION
2-***	123	O-ring	B	MBL***	181	Lockwasher	C
213** SERIES	80-96	Spherical Roller Bearing	B	MS***	182-183	Lockplate	C
222** SERIES	80-96	Spherical Roller Bearing	B	N***	132-135	Locknut	B
223** SERIES	80-96	Spherical Roller Bearing	B	OH***H	152-155	Hydraulic Adapter Sleeve	C
